[70971] Another function of VGAM2019 is therefore inhibition of LOC150225 (Accession XM_097870). Accordingly, utilities of VGAM2019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150225. LOC91526 (Accession XM_038985) is another VGAM2019 host target gene. LOC91526 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91526, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91526 BINDING SITE, designated SEQ ID:32971, to the nucleotide sequence of VGAM2019 RNA, herein designated VGAM RNA, also designated SEQ ID:4730.

[70972] Another function of VGAM2019 is therefore inhibition of LOC91526 (Accession XM_038985). Accordingly, utilities of VGAM2019 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91526. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2020 (VGAM2020) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[70973] VGAM2020 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2020 was detected is described hereinabove with reference to Figs. 1-8.

[70974] VGAM2020 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola Virus (ZEBOV). VGAM2020 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[70975] VGAM2020 gene encodes a VGAM2020 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2020 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2020 precursor RNA is designated SEQ ID:2006, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2006 is located at position 8150 relative to the genome of Zaire Ebola Virus (ZEBOV).

[70976] VGAM2020 precursor RNA folds onto itself, forming VGAM2020 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[70977] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2020 folded precursor RNA into VGAM2020

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM2020 RNA is designated SEQ ID:4731, and is provided hereinbelow with reference to the sequence listing part.

[70978] VGAM2020 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2020 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2020 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[70979] VGAM2020 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2020 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2020 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2020 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2020 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[70980] The complementary binding of VGAM2020 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2020 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2020 host target RNA into VGAM2020 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[70981] It is appreciated that VGAM2020 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2020 host target genes. The mRNA of each one of this plurality of VGAM2020 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2020 RNA, herein designated VGAM RNA, and which when bound by VGAM2020 RNA causes inhibition of translation of respective one or more VGAM2020 host target proteins.

[70982] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2020 gene, herein designated VGAM GENE, on one or more VGAM2020 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[70983] It is yet further appreciated that a function of VGAM2020 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2020 include diagnosis, prevention and treatment of viral infection by Zaire Ebola Virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2020 correlate with, and may be deduced from, the identity of the host target genes which VGAM2020 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[70984] Nucleotide sequences of the VGAM2020 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2020 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2020 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2020 are further described hereinbelow with reference to Table 1.

[70985] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2020 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2020 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[70986] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2020 gene, herein designated VGAM is inhibition of expression of VGAM2020 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2020 correlate with, and may be deduced from, the identity of the target genes which VGAM2020 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[70987] Protein S (alpha) (PROS1, Accession XM_113400) is a VGAM2020 host target gene. PROS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PROS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PROS1 BINDING SITE, designated SEQ ID:42254, to the nucleotide sequence of VGAM2020 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4731.

[70988] A function of VGAM2020 is therefore inhibition of Protein S (alpha) (PROS1, Accession XM_113400). Accordingly, utilities of VGAM2020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROS1. Serine/threonine Kinase 24 (STE20 homolog, yeast) (STK24, Accession NM_003576) is another VGAM2020 host target gene. STK24 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STK24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK24 BINDING SITE, designated SEQ ID:9628, to the nucleotide sequence of VGAM2020 RNA, herein designated VGAM RNA, also designated SEQ ID:4731.

[70989] Another function of VGAM2020 is therefore inhibition of Serine/threonine Kinase 24 (STE20 homolog, yeast) (STK24, Accession NM_003576), a gene which acts on both serine and threonine residues. Accordingly, utilities of VGAM2020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK24. The function of STK24 and its association with

various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1958.SWAP70 (Accession XM_049197) is another VGAM2020 host target gene. SWAP70 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SWAP70, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SWAP70 BINDING SITE, designated SEQ ID:35351, to the nucleotide sequence of VGAM2020 RNA, herein designated VGAM RNA, also designated SEQ ID:4731.

[70990] Another function of VGAM2020 is therefore inhibition of SWAP70 (Accession XM_049197), a gene which is involved not only in nuclear events but also in signaling in B-cell activation. Accordingly, utilities of VGAM2020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SWAP70. The function of SWAP70 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1090.DKFZP564I122 (Accession XM_032397) is another VGAM2020 host target gene. DKFZP564I122 BIND-

ING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564I122, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I122 BINDING SITE, designated SEQ ID:31646, to the nucleotide sequence of VGAM2020 RNA, herein designated VGAM RNA, also designated SEQ ID:4731.

[70991] Another function of VGAM2020 is therefore inhibition of DKFZP564I122 (Accession XM_032397). Accordingly, utilities of VGAM2020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I122. FLJ22724 (Accession NM_024532) is another VGAM2020 host target gene. FLJ22724 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22724, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22724 BINDING SITE, designated SEQ ID:23737, to the nucleotide sequence of VGAM2020 RNA, herein designated VGAM RNA, also designated SEQ ID:4731.

[70992] Another function of VGAM2020 is therefore inhibition of FLJ22724 (Accession NM_024532). Accordingly, utilities of VGAM2020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22724. HERV-H LTR-associating 2 (HHLA2, Accession NM_007072) is another VGAM2020 host target gene. HHLA2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HHLA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HHLA2 BINDING SITE, designated SEQ ID:13938, to the nucleotide sequence of VGAM2020 RNA, herein designated VGAM RNA, also designated SEQ ID:4731.

[70993] Another function of VGAM2020 is therefore inhibition of HERV-H LTR-associating 2 (HHLA2, Accession NM_007072). Accordingly, utilities of VGAM2020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HHLA2. KIAA0871 (Accession NM_014961) is another VGAM2020 host target gene. KIAA0871 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by KIAA0871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0871 BINDING SITE, designated SEQ ID:17335, to the nucleotide sequence of VGAM2020 RNA, herein designated VGAM RNA, also designated SEQ ID:4731.

[70994] Another function of VGAM2020 is therefore inhibition of KIAA0871 (Accession NM_014961). Accordingly, utilities of VGAM2020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0871. KIAA0931 (Accession XM_041191) is another VGAM2020 host target gene. KIAA0931 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0931, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0931 BINDING SITE, designated SEQ ID:33482, to the nucleotide sequence of VGAM2020 RNA, herein designated VGAM RNA, also designated SEQ ID:4731.

[70995] Another function of VGAM2020 is therefore inhibition of KIAA0931 (Accession XM_041191). Accordingly, utilities

of VGAM2020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0931. PTD012 (Accession NM_014039) is another VGAM2020 host target gene. PTD012 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTD012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTD012 BINDING SITE, designated SEQ ID:15270, to the nucleotide sequence of VGAM2020 RNA, herein designated VGAM RNA, also designated SEQ ID:4731.

[70996] Another function of VGAM2020 is therefore inhibition of PTD012 (Accession NM_014039). Accordingly, utilities of VGAM2020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTD012. TAF9-like RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 31kDa (TAF9L, Accession NM_015975) is another VGAM2020 host target gene. TAF9L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAF9L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of TAF9L BINDING SITE, designated SEQ ID:18074, to the nucleotide sequence of VGAM2020 RNA, herein designated VGAM RNA, also designated SEQ ID:4731.

[70997] Another function of VGAM2020 is therefore inhibition of TAF9-like RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 31kDa (TAF9L, Accession NM_015975). Accordingly, utilities of VGAM2020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF9L. LOC152765 (Accession XM_087519) is another VGAM2020 host target gene. LOC152765 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152765, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152765 BINDING SITE, designated SEQ ID:39311, to the nucleotide sequence of VGAM2020 RNA, herein designated VGAM RNA, also designated SEQ ID:4731.

[70998] Another function of VGAM2020 is therefore inhibition of LOC152765 (Accession XM_087519). Accordingly, utilities

of VGAM2020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152765. LOC203286 (Accession XM_117526) is another VGAM2020 host target gene. LOC203286 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203286 BINDING SITE, designated SEQ ID:43493, to the nucleotide sequence of VGAM2020 RNA, herein designated VGAM RNA, also designated SEQ ID:4731.

[70999] Another function of VGAM2020 is therefore inhibition of LOC203286 (Accession XM_117526). Accordingly, utilities of VGAM2020 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203286. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2021 (VGAM2021) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71000] VGAM2021 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2021 was detected is described hereinabove with reference to Figs. 1-8.

[71001] VGAM2021 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola Virus (ZEBOV). VGAM2021 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71002] VGAM2021 gene encodes a VGAM2021 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2021 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2021 precursor RNA is designated SEQ ID:2007, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2007 is located at position 11857 relative to the genome of Zaire Ebola Virus (ZEBOV).

[71003] VGAM2021 precursor RNA folds onto itself, forming VGAM2021 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71004] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2021 folded precursor RNA into VGAM2021 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2021 RNA is designated SEQ ID:4732, and is provided hereinbelow with reference to the sequence listing part.

[71005] VGAM2021 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2021 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2021 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[71006] VGAM2021 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2021 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2021 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2021 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2021 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71007] The complementary binding of VGAM2021 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2021 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2021 host target RNA into VGAM2021 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71008] It is appreciated that VGAM2021 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2021 host target genes. The mRNA of each one of this plurality of VGAM2021 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2021 RNA, herein designated VGAM RNA, and which when bound by VGAM2021 RNA causes inhibition of translation of respective one or more VGAM2021 host target proteins.

[71009] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2021 gene, herein designated VGAM GENE, on one or more VGAM2021 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71010] It is yet further appreciated that a function of VGAM2021 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2021 include diagnosis, prevention and treatment of viral infection by Zaire Ebola Virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2021 correlate with, and may be deduced from, the identity of the host target genes which VGAM2021 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71011] Nucleotide sequences of the VGAM2021 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2021 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2021 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2021 are further described hereinbelow with reference to Table 1.

[71012] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2021 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2021 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71013] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2021 gene, herein designated VGAM is inhibition of expression of VGAM2021 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2021 correlate with, and may be deduced from, the identity of the target genes which VGAM2021 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71014] DNA (cytosine-5-)-methyltransferase 3 Beta (DNMT3B, Accession NM_006892) is a VGAM2021 host target gene.

DNMT3B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DNMT3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNMT3B BINDING SITE, designated SEQ ID:13763, to the nucleotide sequence of VGAM2021 RNA, herein designated VGAM RNA, also designated SEQ ID:4732.

[71015] A function of VGAM2021 is therefore inhibition of DNA (cytosine-5-)-methyltransferase 3 Beta (DNMT3B, Accession NM_006892), a gene which is required for genome wide de novo methylation. Accordingly, utilities of VGAM2021 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNMT3B. The function of DNMT3B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM280.Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, Drosophila) (PDE4D, Accession XM_056815) is another VGAM2021 host target gene. PDE4D BINDING SITE is HOST TARGET binding site found in the 5` untranslated region

of mRNA encoded by PDE4D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4D BINDING SITE, designated SEQ ID:36432, to the nucleotide sequence of VGAM2021 RNA, herein designated VGAM RNA, also designated SEQ ID:4732.

[71016] Another function of VGAM2021 is therefore inhibition of Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, Drosophila) (PDE4D, Accession XM_056815), a gene which has similarity to Drosophila dnc, which is the affected protein in learning and memory mutant dunce. Accordingly, utilities of VGAM2021 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4D. The function of PDE4D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180.Interferon Regulatory Factor 7 (IRF7, Accession NM_004030) is another VGAM2021 host target gene. IRF7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IRF7, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRF7 BINDING SITE, designated SEQ ID:10251, to the nucleotide sequence of VGAM2021 RNA, herein designated VGAM RNA, also designated SEQ ID:4732.

[71017] Another function of VGAM2021 is therefore inhibition of Interferon Regulatory Factor 7 (IRF7, Accession NM_004030). Accordingly, utilities of VGAM2021 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRF7. KIAA0226 (Accession XM_032901) is another VGAM2021 host target gene. KIAA0226 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0226, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0226 BINDING SITE, designated SEQ ID:31786, to the nucleotide sequence of VGAM2021 RNA, herein designated VGAM RNA, also designated SEQ ID:4732.

[71018] Another function of VGAM2021 is therefore inhibition of KIAA0226 (Accession XM_032901). Accordingly, utilities of VGAM2021 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0226. KIAA0433 (Accession NM_015216) is another VGAM2021 host target gene. KIAA0433 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0433, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0433 BINDING SITE, designated SEQ ID:17548, to the nucleotide sequence of VGAM2021 RNA, herein designated VGAM RNA, also designated SEQ ID:4732.

[71019] Another function of VGAM2021 is therefore inhibition of KIAA0433 (Accession NM_015216). Accordingly, utilities of VGAM2021 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0433. VPS39 (Accession XM_031720) is another VGAM2021 host target gene. VPS39 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VPS39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS39 BINDING SITE, designated SEQ ID:31470, to the nucleotide sequence of

VGAM2021 RNA, herein designated VGAM RNA, also designated SEQ ID:4732.

[71020] Another function of VGAM2021 is therefore inhibition of VPS39 (Accession XM_031720). Accordingly, utilities of VGAM2021 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS39. Zinc Finger, DHHC Domain Containing 3 (ZDHHC3, Accession NM_016598) is another VGAM2021 host target gene. ZDHHC3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZDHHC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZDHHC3 BINDING SITE, designated SEQ ID:18688, to the nucleotide sequence of VGAM2021 RNA, herein designated VGAM RNA, also designated SEQ ID:4732.

[71021] Another function of VGAM2021 is therefore inhibition of Zinc Finger, DHHC Domain Containing 3 (ZDHHC3, Accession NM_016598). Accordingly, utilities of VGAM2021 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC3. LOC200213 (Accession XM_114156) is another VGAM2021 host target

gene. LOC200213 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC200213, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200213 BINDING SITE, designated SEQ ID:42740, to the nucleotide sequence of VGAM2021 RNA, herein designated VGAM RNA, also designated SEQ ID:4732.

[71022] Another function of VGAM2021 is therefore inhibition of LOC200213 (Accession XM_114156). Accordingly, utilities of VGAM2021 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200213. LOC222161 (Accession XM_166596) is another VGAM2021 host target gene. LOC222161 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222161 BINDING SITE, designated SEQ ID:44580, to the nucleotide sequence of VGAM2021 RNA, herein designated VGAM RNA, also designated SEQ ID:4732.

[71023] Another function of VGAM2021 is therefore inhibition of LOC222161 (Accession XM_166596). Accordingly, utilities of VGAM2021 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222161. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2022 (VGAM2022) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71024] VGAM2022 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2022 was detected is described hereinabove with reference to Figs. 1-8.

[71025] VGAM2022 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola Virus (ZEBOV). VGAM2022 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71026] VGAM2022 gene encodes a VGAM2022 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2022 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2022 precursor RNA is designated SEQ ID:2008, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2008 is located at position 4390 relative to the genome of Zaire Ebola Virus (ZEBOV).

[71027] VGAM2022 precursor RNA folds onto itself, forming VGAM2022 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71028] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2022 folded precursor RNA into VGAM2022 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2022 RNA is designated SEQ ID:4733, and is provided hereinbelow with reference to the sequence listing part.

[71029] VGAM2022 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2022 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2022 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71030] VGAM2022 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2022 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2022 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2022 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2022 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71031] The complementary binding of VGAM2022 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2022 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2022 host target RNA into VGAM2022 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71032] It is appreciated that VGAM2022 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2022 host target genes. The mRNA of each one of this plurality of VGAM2022 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2022 RNA, herein designated VGAM RNA, and which when bound by VGAM2022 RNA causes inhibition of translation of respective one or more VGAM2022 host target proteins.

[71033] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2022 gene, herein designated VGAM GENE, on one or more VGAM2022 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71034] It is yet further appreciated that a function of VGAM2022 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2022 include diagnosis, prevention and treatment of viral infection by Zaire Ebola Virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2022 correlate with, and may be deduced from, the identity of the host target genes which VGAM2022 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71035] Nucleotide sequences of the VGAM2022 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2022 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2022 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2022 are further described hereinbelow with reference to Table 1.

[71036] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2022 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2022 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[71037] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2022 gene, herein designated VGAM is inhibition of expression of VGAM2022 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2022 correlate with, and may be deduced from, the identity of the target genes which VGAM2022 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71038] NEL-like 2 (chicken) (NELL2, Accession NM_006159) is a VGAM2022 host target gene. NELL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NELL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NELL2 BINDING SITE, designated SEQ ID:12812, to the nucleotide sequence of VGAM2022 RNA, herein designated VGAM RNA, also designated SEQ ID:4733.

[71039] A function of VGAM2022 is therefore inhibition of NEL-like 2 (chicken) (NELL2, Accession NM_006159). Accordingly, utilities of VGAM2022 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with NELL2. AWP1 (Accession NM_019006) is another VGAM2022 host target gene. AWP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AWP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AWP1 BINDING SITE, designated SEQ ID:21080, to the nucleotide sequence of VGAM2022 RNA, herein designated VGAM RNA, also designated SEQ ID:4733.

[71040] Another function of VGAM2022 is therefore inhibition of AWP1 (Accession NM_019006). Accordingly, utilities of VGAM2022 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AWP1. FLJ10520 (Accession NM_018124) is another VGAM2022 host target gene. FLJ10520 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10520 BINDING SITE, designated SEQ ID:19904, to the nucleotide sequence of VGAM2022 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4733.

[71041] Another function of VGAM2022 is therefore inhibition of FLJ10520 (Accession NM_018124). Accordingly, utilities of VGAM2022 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10520. FLJ13657 (Accession NM_024828) is another VGAM2022 host target gene. FLJ13657 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13657 BINDING SITE, designated SEQ ID:24219, to the nucleotide sequence of VGAM2022 RNA, herein designated VGAM RNA, also designated SEQ ID:4733.

[71042] Another function of VGAM2022 is therefore inhibition of FLJ13657 (Accession NM_024828). Accordingly, utilities of VGAM2022 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13657. Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841) is another VGAM2022 host target gene. OSBPL8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

OSBPL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL8 BINDING SITE, designated SEQ ID:21908, to the nucleotide sequence of VGAM2022 RNA, herein designated VGAM RNA, also designated SEQ ID:4733.

[71043] Another function of VGAM2022 is therefore inhibition of Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841). Accordingly, utilities of VGAM2022 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL8. PRO2964 (Accession NM_018547) is another VGAM2022 host target gene. PRO2964 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO2964, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2964 BINDING SITE, designated SEQ ID:20631, to the nucleotide sequence of VGAM2022 RNA, herein designated VGAM RNA, also designated SEQ ID:4733.

[71044] Another function of VGAM2022 is therefore inhibition of

PRO2964 (Accession NM_018547). Accordingly, utilities of VGAM2022 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2964. LOC146237 (Accession XM_096954) is another VGAM2022 host target gene. LOC146237 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146237 BINDING SITE, designated SEQ ID:40668, to the nucleotide sequence of VGAM2022 RNA, herein designated VGAM RNA, also designated SEQ ID:4733.

[71045] Another function of VGAM2022 is therefore inhibition of LOC146237 (Accession XM_096954). Accordingly, utilities of VGAM2022 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146237. LOC158381 (Accession XM_048461) is another VGAM2022 host target gene. LOC158381 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158381, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC158381 BINDING SITE, designated SEQ ID:35176, to the nucleotide sequence of VGAM2022 RNA, herein designated VGAM RNA, also designated SEQ ID:4733.

[71046] Another function of VGAM2022 is therefore inhibition of LOC158381 (Accession XM_048461). Accordingly, utilities of VGAM2022 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158381. LOC89231 (Accession XM_166577) is another VGAM2022 host target gene. LOC89231 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC89231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89231 BINDING SITE, designated SEQ ID:44551, to the nucleotide sequence of VGAM2022 RNA, herein designated VGAM RNA, also designated SEQ ID:4733.

[71047] Another function of VGAM2022 is therefore inhibition of LOC89231 (Accession XM_166577). Accordingly, utilities of VGAM2022 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89231. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2023 (VGAM2023) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71048] VGAM2023 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2023 was detected is described hereinabove with reference to Figs. 1-8.

[71049] VGAM2023 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola Virus (ZEBOV). VGAM2023 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71050] VGAM2023 gene encodes a VGAM2023 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2023 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2023 precursor RNA is designated SEQ ID:2009, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2009 is located at position 11139 relative to the genome of Zaire Ebola Virus (ZEBOV).

[71051] VGAM2023 precursor RNA folds onto itself, forming VGAM2023 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71052] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2023 folded precursor RNA into VGAM2023 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM2023 RNA is designated SEQ ID:4734, and is provided hereinbelow with reference to the sequence listing part.

[71053] VGAM2023 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2023 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2023 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71054] VGAM2023 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2023 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2023 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2023 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2023 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71055] The complementary binding of VGAM2023 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2023 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2023 host target RNA into VGAM2023 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71056] It is appreciated that VGAM2023 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2023 host target genes. The mRNA of each one of this plurality of VGAM2023 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2023 RNA, herein designated VGAM RNA, and which when bound by VGAM2023 RNA causes inhibition of translation of respective one or more

VGAM2023 host target proteins.

[71057] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2023 gene, herein designated VGAM GENE, on one or more VGAM2023 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71058] It is yet further appreciated that a function of VGAM2023 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2023 include diagnosis, prevention and treatment of viral infection by Zaire Ebola Virus (ZEBOV).

Specific functions, and accordingly utilities, of VGAM2023 correlate with, and may be deduced from, the identity of the host target genes which VGAM2023 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71059] Nucleotide sequences of the VGAM2023 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2023 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2023 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2023 are further described hereinbelow with reference to Table 1.

[71060] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2023 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2023 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71061] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2023 gene, herein designated VGAM is inhibition of expression of VGAM2023 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2023 correlate with, and may be deduced from, the identity of the target genes which VGAM2023 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71062] Chemokine (C-C motif) Receptor 5 (CCR5, Accession NM_000579) is a VGAM2023 host target gene. CCR5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CCR5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR5 BINDING SITE, designated SEQ ID:6182, to the nucleotide sequence of VGAM2023 RNA, herein designated VGAM RNA, also designated SEQ ID:4734.

[71063] A function of VGAM2023 is therefore inhibition of Chemokine (C-C motif) Receptor 5 (CCR5, Accession NM_000579). Accordingly, utilities of VGAM2023 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR5. KIAA0310 (Accession XM_088459) is another VGAM2023 host target gene. KIAA0310 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0310, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0310 BINDING SITE, designated SEQ ID:39708, to the nucleotide sequence of VGAM2023 RNA, herein designated VGAM RNA, also designated SEQ ID:4734.

[71064] Another function of VGAM2023 is therefore inhibition of KIAA0310 (Accession XM_088459). Accordingly, utilities of VGAM2023 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0310. POLD3 (Accession XM_166243) is another VGAM2023 host target gene. POLD3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POLD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLD3 BINDING SITE, designated SEQ ID:44053, to the nucleotide sequence of VGAM2023 RNA, herein designated VGAM RNA, also designated SEQ ID:4734.

[71065] Another function of VGAM2023 is therefore inhibition of POLD3 (Accession XM_166243). Accordingly, utilities of VGAM2023 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with POLD3. LOC161357 (Accession XM_090827) is another VGAM2023 host target gene. LOC161357 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC161357, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161357 BINDING SITE, designated SEQ ID:40016, to the nucleotide sequence of VGAM2023 RNA, herein designated VGAM RNA, also designated SEQ ID:4734.

[71066] Another function of VGAM2023 is therefore inhibition of LOC161357 (Accession XM_090827). Accordingly, utilities of VGAM2023 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161357. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2024 (VGAM2024) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71067] VGAM2024 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2024 was detected is described hereinabove with reference to Figs. 1-8.

[71068] VGAM2024 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Kyuri Green Mottle Mosaic Virus. VGAM2024 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71069] VGAM2024 gene encodes a VGAM2024 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2024 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2024 precursor RNA is designated SEQ ID:2010, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2010 is located at position 332 relative to the genome of Kyuri Green Mottle Mosaic Virus.

[71070] VGAM2024 precursor RNA folds onto itself, forming VGAM2024 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71071] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2024 folded precursor RNA into VGAM2024 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM2024 RNA is designated SEQ ID:4735, and is provided hereinbelow with reference to the sequence listing part.

[71072] VGAM2024 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2024 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2024 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71073] VGAM2024 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2024 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2024 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2024 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2024 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71074] The complementary binding of VGAM2024 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2024 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2024 host target RNA into VGAM2024 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71075] It is appreciated that VGAM2024 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2024 host target genes. The mRNA of each one of this plurality of VGAM2024 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2024 RNA, herein designated VGAM RNA, and which when bound by VGAM2024 RNA causes inhibition of translation of respective one or more VGAM2024 host target proteins.

[71076] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2024 gene, herein designated VGAM GENE, on one or more VGAM2024 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71077] It is yet further appreciated that a function of VGAM2024 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2024 include diagnosis, prevention and treatment of viral infection by Kyuri Green Mottle Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2024 correlate with, and may be deduced from, the identity of the host target genes which VGAM2024 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71078] Nucleotide sequences of the VGAM2024 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2024 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2024 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2024 are further described hereinbelow with reference to Table 1.

[71079] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2024 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2024 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71080] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2024 gene, herein designated VGAM is inhibition of expression of VGAM2024 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2024 correlate with, and may be deduced from, the identity of the target genes which VGAM2024 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71081] APM1 (Accession NM_004797) is a VGAM2024 host target gene. APM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

APM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APM1 BINDING SITE, designated SEQ ID:11213, to the nucleotide sequence of VGAM2024 RNA, herein designated VGAM RNA, also designated SEQ ID:4735.

[71082] A function of VGAM2024 is therefore inhibition of APM1 (Accession NM_004797). Accordingly, utilities of VGAM2024 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APM1. Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM_013423) is another VGAM2024 host target gene. ARHGAP6 BINDING SITE1 and ARHGAP6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ARHGAP6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP6 BINDING SITE1 and ARHGAP6 BINDING SITE2, designated SEQ ID:15085 and SEQ ID:6847 respectively, to the nucleotide sequence of VGAM2024 RNA, herein designated VGAM RNA, also designated SEQ ID:4735.

[71083] Another function of VGAM2024 is therefore inhibition of

Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM_013423), a gene which activates the rho-type GTPases by converting them to an inactive GTP-bound state. Accordingly, utilities of VGAM2024 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP6. The function of ARHGAP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.Vinculin (VCL, Accession NM_014000) is another VGAM2024 host target gene. VCL BINDING SITE1 and VCL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by VCL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VCL BINDING SITE1 and VCL BINDING SITE2, designated SEQ ID:15193 and SEQ ID:9404 respectively, to the nucleotide sequence of VGAM2024 RNA, herein designated VGAM RNA, also designated SEQ ID:4735.

[71084] Another function of VGAM2024 is therefore inhibition of Vinculin (VCL, Accession NM_014000). Accordingly, utilities of VGAM2024 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with VCL. BPES (Accession NM_023067) is another VGAM2024 host target gene. BPES BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BPES, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BPES BINDING SITE, designated SEQ ID:23325, to the nucleotide sequence of VGAM2024 RNA, herein designated VGAM RNA, also designated SEQ ID:4735.

[71085] Another function of VGAM2024 is therefore inhibition of BPES (Accession NM_023067). Accordingly, utilities of VGAM2024 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BPES. FLJ11722 (Accession NM_024970) is another VGAM2024 host target gene. FLJ11722 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11722, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11722 BINDING SITE, designated SEQ ID:24518, to the nucleotide sequence of

VGAM2024 RNA, herein designated VGAM RNA, also designated SEQ ID:4735.

[71086] Another function of VGAM2024 is therefore inhibition of FLJ11722 (Accession NM_024970). Accordingly, utilities of VGAM2024 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11722. pcnp (Accession NM_020357) is another VGAM2024 host target gene. pcnp BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by pcnp, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of pcnp BINDING SITE, designated SEQ ID:21629, to the nucleotide sequence of VGAM2024 RNA, herein designated VGAM RNA, also designated SEQ ID:4735.

[71087] Another function of VGAM2024 is therefore inhibition of pcnp (Accession NM_020357). Accordingly, utilities of VGAM2024 include diagnosis, prevention and treatment of diseases and clinical conditions associated with pcnp. Zinc Finger Protein 297B (ZNF297B, Accession NM_014007) is another VGAM2024 host target gene. ZNF297B BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by ZNF297B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF297B BINDING SITE, designated SEQ ID:15221, to the nucleotide sequence of VGAM2024 RNA, herein designated VGAM RNA, also designated SEQ ID:4735.

[71088] Another function of VGAM2024 is therefore inhibition of Zinc Finger Protein 297B (ZNF297B, Accession NM_014007). Accordingly, utilities of VGAM2024 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF297B. LOC150139 (Accession XM_086794) is another VGAM2024 host target gene. LOC150139 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150139 BINDING SITE, designated SEQ ID:38859, to the nucleotide sequence of VGAM2024 RNA, herein designated VGAM RNA, also designated SEQ ID:4735.

[71089] Another function of VGAM2024 is therefore inhibition of LOC150139 (Accession XM_086794). Accordingly, utilities of VGAM2024 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150139. LOC92597 (Accession XM_046066) is another VGAM2024 host target gene. LOC92597 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92597, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92597 BINDING SITE, designated SEQ ID:34675, to the nucleotide sequence of VGAM2024 RNA, herein designated VGAM RNA, also designated SEQ ID:4735.

[71090] Another function of VGAM2024 is therefore inhibition of LOC92597 (Accession XM_046066). Accordingly, utilities of VGAM2024 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92597. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2025 (VGAM2025) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[71091] VGAM2025 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2025 was detected is described hereinabove with reference to Figs. 1-8.

[71092] VGAM2025 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Kyuri Green Mottle Mosaic Virus. VGAM2025 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71093] VGAM2025 gene encodes a VGAM2025 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2025 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2025 precursor RNA is designated SEQ ID:2011, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2011 is located at position 4374 relative to the genome of Kyuri Green Mottle Mosaic Virus.

[71094] VGAM2025 precursor RNA folds onto itself, forming VGAM2025 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71095] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2025 folded precursor RNA into VGAM2025 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2025 RNA is designated SEQ ID:4736, and is provided hereinbelow with reference to the sequence listing part.

[71096] VGAM2025 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2025 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2025 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71097] VGAM2025 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2025 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2025 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2025 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2025 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71098] The complementary binding of VGAM2025 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2025 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2025 host target RNA into VGAM2025 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71099] It is appreciated that VGAM2025 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2025 host target genes. The mRNA of each one of this plurality of VGAM2025 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2025 RNA, herein designated VGAM RNA, and which when bound by VGAM2025 RNA causes inhibition of translation of respective one or more VGAM2025 host target proteins.

[71100] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2025 gene, herein designated VGAM GENE, on one or more VGAM2025 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71101] It is yet further appreciated that a function of VGAM2025 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2025 include diagnosis, prevention and treatment of viral infection by Kyuri Green Mottle Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2025 correlate with, and may be deduced from, the identity of the host target genes which VGAM2025 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[71102] Nucleotide sequences of the VGAM2025 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2025 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2025 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2025 are further described hereinbelow with reference to Table 1.

[71103] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2025 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2025 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71104] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2025 gene, herein designated VGAM is inhibition of expression of VGAM2025 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2025 correlate with, and may be deduced from, the identity of the target genes which VGAM2025 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71105] UMP-CMPK (Accession NM_016308) is a VGAM2025 host target gene. UMP-CMPK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UMP-CMPK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UMP-CMPK BINDING SITE, designated SEQ ID:18426, to the nucleotide sequence of VGAM2025 RNA, herein designated VGAM RNA, also designated SEQ ID:4736.

[71106] A function of VGAM2025 is therefore inhibition of UMP-CMPK (Accession NM_016308). Accordingly, utilities of VGAM2025 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UMP-CMPK. LOC151959 (Accession XM_098144) is another VGAM2025 host target gene. LOC151959 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151959, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151959 BINDING SITE, designated SEQ ID:41409, to the nucleotide sequence of VGAM2025 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4736.

[71107] Another function of VGAM2025 is therefore inhibition of LOC151959 (Accession XM_098144). Accordingly, utilities of VGAM2025 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151959. LOC203197 (Accession XM_114645) is another VGAM2025 host target gene. LOC203197 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203197 BINDING SITE, designated SEQ ID:43011, to the nucleotide sequence of VGAM2025 RNA, herein designated VGAM RNA, also designated SEQ ID:4736.

[71108] Another function of VGAM2025 is therefore inhibition of LOC203197 (Accession XM_114645). Accordingly, utilities of VGAM2025 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203197. LOC221431 (Accession XM_166380) is another VGAM2025 host target gene. LOC221431 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221431, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221431 BINDING SITE, designated SEQ ID:44220, to the nucleotide sequence of VGAM2025 RNA, herein designated VGAM RNA, also designated SEQ ID:4736.

[71109] Another function of VGAM2025 is therefore inhibition of LOC221431 (Accession XM_166380). Accordingly, utilities of VGAM2025 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221431. LOC93589 (Accession XM_052387) is another VGAM2025 host target gene. LOC93589 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93589, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93589 BINDING SITE, designated SEQ ID:35975, to the nucleotide sequence of VGAM2025 RNA, herein designated VGAM RNA, also designated SEQ ID:4736.

[71110] Another function of VGAM2025 is therefore inhibition of LOC93589 (Accession XM_052387). Accordingly, utilities of VGAM2025 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC93589. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2026 (VGAM2026) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71111] VGAM2026 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2026 was detected is described hereinabove with reference to Figs. 1-8.

[71112] VGAM2026 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola Virus (ZEBOV). VGAM2026 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71113] VGAM2026 gene encodes a VGAM2026 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2026 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2026 precursor RNA is desig-

nated SEQ ID:2012, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2012 is located at position 18253 relative to the genome of Zaire Ebola Virus (ZEBOV).

[71114] VGAM2026 precursor RNA folds onto itself, forming VGAM2026 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71115] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2026 folded precursor RNA into VGAM2026 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2026 RNA is designated SEQ ID:4737, and is provided hereinbelow with reference to the sequence

listing part.

[71116] VGAM2026 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2026 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2026 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71117] VGAM2026 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2026 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2026 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2026 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2026 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71118] The complementary binding of VGAM2026 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2026 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2026 host target RNA into VGAM2026 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71119] It is appreciated that VGAM2026 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2026 host target genes. The mRNA of each one of this plurality of VGAM2026 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2026 RNA, herein designated VGAM

RNA, and which when bound by VGAM2026 RNA causes inhibition of translation of respective one or more VGAM2026 host target proteins.

[71120] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2026 gene, herein designated VGAM GENE, on one or more VGAM2026 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71121] It is yet further appreciated that a function of VGAM2026 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2026 include diagnosis, prevention and treatment of viral infection by Zaire Ebola Virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2026 correlate with, and may be deduced from, the identity of the host target genes which VGAM2026 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71122] Nucleotide sequences of the VGAM2026 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2026 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2026 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2026 are further described hereinbelow with reference to Table 1.

[71123] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2026 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2026 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71124] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2026 gene, herein designated VGAM is

inhibition of expression of VGAM2026 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2026 correlate with, and may be deduced from, the identity of the target genes which VGAM2026 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71125] Lysophospholipase I (LYPLA1, Accession NM_006330) is a VGAM2026 host target gene. LYPLA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LYPLA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LYPLA1 BINDING SITE, designated SEQ ID:13029, to the nucleotide sequence of VGAM2026 RNA, herein designated VGAM RNA, also designated SEQ ID:4737.

[71126] A function of VGAM2026 is therefore inhibition of Lysophospholipase I (LYPLA1, Accession NM_006330). Accordingly, utilities of VGAM2026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LYPLA1. BM-002 (Accession NM_016617) is another VGAM2026 host target gene. BM-002 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by BM-002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BM-002 BINDING SITE, designated SEQ ID:18727, to the nucleotide sequence of VGAM2026 RNA, herein designated VGAM RNA, also designated SEQ ID:4737.

[71127] Another function of VGAM2026 is therefore inhibition of BM-002 (Accession NM_016617). Accordingly, utilities of VGAM2026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BM-002. DKFZP564I052 (Accession XM_039660) is another VGAM2026 host target gene. DKFZP564I052 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564I052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I052 BINDING SITE, designated SEQ ID:33139, to the nucleotide sequence of VGAM2026 RNA, herein designated VGAM RNA, also designated SEQ ID:4737.

[71128] Another function of VGAM2026 is therefore inhibition of DKFZP564I052 (Accession XM_039660). Accordingly, utili-

ties of VGAM2026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I052. Erythroblast Membrane-associated Protein (ERMAP, Accession NM_018538) is another VGAM2026 host target gene. ERMAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ERMAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERMAP BINDING SITE, designated SEQ ID:20610, to the nucleotide sequence of VGAM2026 RNA, herein designated VGAM RNA, also designated SEQ ID:4737.

[71129] Another function of VGAM2026 is therefore inhibition of Erythroblast Membrane-associated Protein (ERMAP, Accession NM_018538). Accordingly, utilities of VGAM2026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERMAP. FLJ13441 (Accession NM_023924) is another VGAM2026 host target gene. FLJ13441 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ13441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13441 BINDING SITE, designated SEQ ID:23400, to the nucleotide sequence of VGAM2026 RNA, herein designated VGAM RNA, also designated SEQ ID:4737.

[71130] Another function of VGAM2026 is therefore inhibition of FLJ13441 (Accession NM_023924). Accordingly, utilities of VGAM2026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13441. FLJ14751 (Accession NM_032834) is another VGAM2026 host target gene. FLJ14751 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14751, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14751 BINDING SITE, designated SEQ ID:26610, to the nucleotide sequence of VGAM2026 RNA, herein designated VGAM RNA, also designated SEQ ID:4737.

[71131] Another function of VGAM2026 is therefore inhibition of FLJ14751 (Accession NM_032834). Accordingly, utilities of VGAM2026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ14751. NAG14 (Accession NM_022143) is another VGAM2026 host target gene. NAG14 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NAG14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAG14 BINDING SITE, designated SEQ ID:22707, to the nucleotide sequence of VGAM2026 RNA, herein designated VGAM RNA, also designated SEQ ID:4737.

[71132] Another function of VGAM2026 is therefore inhibition of NAG14 (Accession NM_022143). Accordingly, utilities of VGAM2026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAG14. N-ethylmaleimide-sensitive Factor Attachment Protein, Gamma (NAPG, Accession XM_172983) is another VGAM2026 host target gene. NAPG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NAPG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAPG BINDING SITE, designated SEQ ID:46252, to the nucleotide sequence of

VGAM2026 RNA, herein designated VGAM RNA, also designated SEQ ID:4737.

[71133] Another function of VGAM2026 is therefore inhibition of N-ethylmaleimide-sensitive Factor Attachment Protein, Gamma (NAPG, Accession XM_172983). Accordingly, utilities of VGAM2026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAPG. LOC91115 (Accession XM_036218) is another VGAM2026 host target gene. LOC91115 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91115, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91115 BINDING SITE, designated SEQ ID:32398, to the nucleotide sequence of VGAM2026 RNA, herein designated VGAM RNA, also designated SEQ ID:4737.

[71134] Another function of VGAM2026 is therefore inhibition of LOC91115 (Accession XM_036218). Accordingly, utilities of VGAM2026 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91115. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2027 (VGAM2027) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71135] VGAM2027 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2027 was detected is described hereinabove with reference to Figs. 1-8.

[71136] VGAM2027 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Kyuri Green Mottle Mosaic Virus. VGAM2027 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71137] VGAM2027 gene encodes a VGAM2027 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2027 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2027 precursor RNA is designated SEQ ID:2013, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2013 is located at position 4198 relative to the

genome of Kyuri Green Mottle Mosaic Virus.

[71138] VGAM2027 precursor RNA folds onto itself, forming VGAM2027 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71139] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2027 folded precursor RNA into VGAM2027 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2027 RNA is designated SEQ ID:4738, and is provided hereinbelow with reference to the sequence listing part.

[71140] VGAM2027 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2027 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2027 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71141] VGAM2027 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2027 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2027 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2027 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2027 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71142] The complementary binding of VGAM2027 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2027 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2027 host target RNA into VGAM2027 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71143] It is appreciated that VGAM2027 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2027 host target genes. The mRNA of each one of this plurality of VGAM2027 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2027 RNA, herein designated VGAM RNA, and which when bound by VGAM2027 RNA causes inhibition of translation of respective one or more VGAM2027 host target proteins.

[71144] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2027 gene, herein designated VGAM GENE, on one or more VGAM2027 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71145] It is yet further appreciated that a function of VGAM2027 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2027 include diagnosis, prevention and treatment of viral infection by Kyuri Green Mottle Mosaic Virus. Specific functions, and accordingly utilities, of

VGAM2027 correlate with, and may be deduced from, the identity of the host target genes which VGAM2027 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71146] Nucleotide sequences of the VGAM2027 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2027 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2027 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2027 are further described hereinbelow with reference to Table 1.

[71147] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2027 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2027 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71148] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2027 gene, herein designated VGAM is inhibition of expression of VGAM2027 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2027 correlate with, and may be deduced

from, the identity of the target genes which VGAM2027 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71149] FLJ13769 (Accession NM_025012) is a VGAM2027 host target gene. FLJ13769 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13769, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13769 BINDING SITE, designated SEQ ID:24589, to the nucleotide sequence of VGAM2027 RNA, herein designated VGAM RNA, also designated SEQ ID:4738.

[71150] A function of VGAM2027 is therefore inhibition of FLJ13769 (Accession NM_025012). Accordingly, utilities of VGAM2027 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13769. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2028 (VGAM2028) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[71151] VGAM2028 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2028 was detected is described hereinabove with reference to Figs. 1-8.

[71152] VGAM2028 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola Virus (ZEBOV). VGAM2028 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71153] VGAM2028 gene encodes a VGAM2028 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2028 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2028 precursor RNA is designated SEQ ID:2014, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2014 is located at position 16037 relative to the genome of Zaire Ebola Virus (ZEBOV).

[71154] VGAM2028 precursor RNA folds onto itself, forming VGAM2028 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71155] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2028 folded precursor RNA into VGAM2028 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM2028 RNA is designated SEQ ID:4739, and is provided hereinbelow with reference to the sequence listing part.

[71156] VGAM2028 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2028 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2028 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71157] VGAM2028 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2028 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2028 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2028 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2028 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[71158] The complementary binding of VGAM2028 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2028 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2028 host target RNA into VGAM2028 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71159] It is appreciated that VGAM2028 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2028 host target genes. The mRNA of each one of this plurality of VGAM2028 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2028 RNA, herein designated VGAM RNA, and which when bound by VGAM2028 RNA causes inhibition of translation of respective one or more VGAM2028 host target proteins.

[71160] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2028 gene, herein designated VGAM GENE, on one

or more VGAM2028 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71161] It is yet further appreciated that a function of VGAM2028 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2028 include diagnosis, prevention and treatment of viral infection by Zaire Ebola Virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2028 correlate with, and may be deduced from, the identity of the host target genes which VGAM2028 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71162] Nucleotide sequences of the VGAM2028 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2028 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2028 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2028 are further described hereinbelow with reference to Table 1.

[71163] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2028 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2028 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71164] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2028 gene, herein designated VGAM is inhibition of expression of VGAM2028 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2028 correlate with, and may be deduced from, the identity of the target genes which VGAM2028 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71165] Hypermethylated In Cancer 2 (HIC2, Accession

XM_036937) is a VGAM2028 host target gene. HIC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HIC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIC2 BINDING SITE, designated SEQ ID:32527, to the nucleotide sequence of VGAM2028 RNA, herein designated VGAM RNA, also designated SEQ ID:4739.

[71166] A function of VGAM2028 is therefore inhibition of Hypermethylated In Cancer 2 (HIC2, Accession XM_036937). Accordingly, utilities of VGAM2028 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIC2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2029 (VGAM2029) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71167] VGAM2029 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2029 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[71168] VGAM2029 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola Virus (ZEBOV). VGAM2029 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71169] VGAM2029 gene encodes a VGAM2029 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2029 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2029 precursor RNA is designated SEQ ID:2015, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2015 is located at position 17355 relative to the genome of Zaire Ebola Virus (ZEBOV).

[71170] VGAM2029 precursor RNA folds onto itself, forming VGAM2029 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71171] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2029 folded precursor RNA into VGAM2029 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2029 RNA is designated SEQ ID:4740, and is provided hereinbelow with reference to the sequence listing part.

[71172] VGAM2029 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2029 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2029 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71173] VGAM2029 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2029 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2029 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2029 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2029 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71174] The complementary binding of VGAM2029 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2029 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2029 host target RNA into VGAM2029 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71175] It is appreciated that VGAM2029 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2029 host target genes. The mRNA of each one of this plurality of VGAM2029 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2029 RNA, herein designated VGAM RNA, and which when bound by VGAM2029 RNA causes inhibition of translation of respective one or more VGAM2029 host target proteins.

[71176] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2029 gene, herein designated VGAM GENE, on one or more VGAM2029 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71177] It is yet further appreciated that a function of VGAM2029 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2029 include diagnosis, prevention and treatment of viral infection by Zaire Ebola Virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2029 correlate with, and may be deduced from, the identity of the host target genes which VGAM2029 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71178] Nucleotide sequences of the VGAM2029 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2029 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2029 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2029 are further described hereinbelow with reference to Table 1.

[71179] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2029 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2029 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71180] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2029 gene, herein designated VGAM is inhibition of expression of VGAM2029 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2029 correlate with, and may be deduced from, the identity of the target genes which VGAM2029 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71181] Heparanase (HPSE, Accession NM_006665) is a VGAM2029 host target gene. HPSE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HPSE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPSE BINDING SITE, designated SEQ ID:13479, to the nucleotide sequence of VGAM2029 RNA, herein designated VGAM RNA, also designated SEQ ID:4740.

[71182] A function of VGAM2029 is therefore inhibition of Heparanase (HPSE, Accession NM_006665), a gene which is an endoglycosidase that cleaves heparan sulfate. Accordingly, utilities of VGAM2029 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPSE. The function of HPSE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM374.DAMS (Accession NM_022001) is another VGAM2029 host target gene. DAMS BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DAMS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAMS BINDING SITE, designated SEQ ID:22542, to the nucleotide sequence of VGAM2029 RNA, herein designated VGAM RNA, also designated SEQ ID:4740.

[71183] Another function of VGAM2029 is therefore inhibition of DAMS (Accession NM_022001). Accordingly, utilities of VGAM2029 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAMS. FLJ13262 (Accession NM_024914) is another VGAM2029 host target gene. FLJ13262 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13262, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13262 BINDING SITE, designated SEQ ID:24434, to the nucleotide sequence of VGAM2029 RNA, herein designated VGAM RNA, also designated SEQ ID:4740.

[71184] Another function of VGAM2029 is therefore inhibition of FLJ13262 (Accession NM_024914). Accordingly, utilities of VGAM2029 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13262. SFRS Protein Kinase 1 (SRPK1, Accession NM_003137) is another VGAM2029 host target gene. SRPK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SRPK1, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRPK1 BINDING SITE, designated SEQ ID:9108, to the nucleotide sequence of VGAM2029 RNA, herein designated VGAM RNA, also designated SEQ ID:4740.

[71185] Another function of VGAM2029 is therefore inhibition of SFRS Protein Kinase 1 (SRPK1, Accession NM_003137). Accordingly, utilities of VGAM2029 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRPK1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2030 (VGAM2030) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71186] VGAM2030 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2030 was detected is described hereinabove with reference to Figs. 1-8.

[71187] VGAM2030 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola Virus (ZEBOV). VGAM2030 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71188] VGAM2030 gene encodes a VGAM2030 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2030 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2030 precursor RNA is designated SEQ ID:2016, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2016 is located at position 12693 relative to the genome of Zaire Ebola Virus (ZEBOV).

[71189] VGAM2030 precursor RNA folds onto itself, forming VGAM2030 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71190] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2030 folded precursor RNA into VGAM2030

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2030 RNA is designated SEQ ID:4741, and is provided hereinbelow with reference to the sequence listing part.

[71191] VGAM2030 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2030 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2030 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71192] VGAM2030 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2030 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2030 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2030 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2030 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71193] The complementary binding of VGAM2030 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2030 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2030 host target RNA into VGAM2030 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[71194] It is appreciated that VGAM2030 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2030 host target genes. The mRNA of each one of this plurality of VGAM2030 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2030 RNA, herein designated VGAM RNA, and which when bound by VGAM2030 RNA causes inhibition of translation of respective one or more VGAM2030 host target proteins.

[71195] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2030 gene, herein designated VGAM GENE, on one or more VGAM2030 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71196] It is yet further appreciated that a function of VGAM2030 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2030 include diagnosis, prevention and treatment of viral infection by Zaire Ebola Virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2030 correlate with, and may be deduced from, the identity of the host target genes which VGAM2030 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71197] Nucleotide sequences of the VGAM2030 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2030 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2030 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2030 are further described hereinbelow with reference to Table 1.

[71198] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2030 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2030 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71199] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2030 gene, herein designated VGAM is inhibition of expression of VGAM2030 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2030 correlate with, and may be deduced from, the identity of the target genes which VGAM2030 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71200] Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM_002655) is a VGAM2030 host target gene. PLAG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAG1 BINDING SITE, designated SEQ ID:8524, to the nucleotide sequence of VGAM2030 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4741.

[71201] A function of VGAM2030 is therefore inhibition of Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM_002655), a gene which contains a zinc finger domain. Accordingly, utilities of VGAM2030 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAG1. The function of PLAG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM29.Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841) is another VGAM2030 host target gene. OSBPL8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OSBPL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL8 BINDING SITE, designated SEQ ID:21907, to the nucleotide sequence of VGAM2030 RNA, herein designated VGAM RNA, also designated SEQ ID:4741.

[71202] Another function of VGAM2030 is therefore inhibition of Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841). Accordingly, utilities of VGAM2030 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL8. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2031 (VGAM2031) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71203] VGAM2031 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2031 was detected is described hereinabove with reference to Figs. 1-8.

[71204] VGAM2031 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola Virus (ZEBOV). VGAM2031 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71205] VGAM2031 gene encodes a VGAM2031 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2031 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2031 precursor RNA is desig-

nated SEQ ID:2017, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2017 is located at position 9873 relative to the genome of Zaire Ebola Virus (ZEBOV).

[71206] VGAM2031 precursor RNA folds onto itself, forming VGAM2031 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71207] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2031 folded precursor RNA into VGAM2031 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM2031 RNA is designated SEQ ID:4742, and is provided hereinbelow with reference to the sequence

listing part.

[71208] VGAM2031 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2031 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2031 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71209] VGAM2031 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2031 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2031 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2031 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2031 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71210] The complementary binding of VGAM2031 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2031 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2031 host target RNA into VGAM2031 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71211] It is appreciated that VGAM2031 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2031 host target genes. The mRNA of each one of this plurality of VGAM2031 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2031 RNA, herein designated VGAM

RNA, and which when bound by VGAM2031 RNA causes inhibition of translation of respective one or more VGAM2031 host target proteins.

[71212] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2031 gene, herein designated VGAM GENE, on one or more VGAM2031 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71213] It is yet further appreciated that a function of VGAM2031 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2031 include diagnosis, prevention and treatment of viral infection by Zaire Ebola Virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2031 correlate with, and may be deduced from, the identity of the host target genes which VGAM2031 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71214] Nucleotide sequences of the VGAM2031 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2031 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2031 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2031 are further described hereinbelow with reference to Table 1.

[71215] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2031 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2031 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71216] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2031 gene, herein designated VGAM is

inhibition of expression of VGAM2031 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2031 correlate with, and may be deduced from, the identity of the target genes which VGAM2031 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71217] Carcinoembryonic Antigen-related Cell Adhesion Molecule 1 (biliary glycoprotein) (CEACAM1, Accession NM_001712) is a VGAM2031 host target gene. CEACAM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CEACAM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEACAM1 BINDING SITE, designated SEQ ID:7442, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71218] A function of VGAM2031 is therefore inhibition of Carcinoembryonic Antigen-related Cell Adhesion Molecule 1 (biliary glycoprotein) (CEACAM1, Accession NM_001712), a gene which is a major effector of VEGF and may be a target for the inhibition of tumor angiogenesis. Accordingly, utilities of VGAM2031 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with CEACAM1. The function of CEACAM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM93.EphB2 (EPHB2, Accession NM_004442) is another VGAM2031 host target gene. EPHB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPHB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHB2 BINDING SITE, designated SEQ ID:10734, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71219] Another function of VGAM2031 is therefore inhibition of EphB2 (EPHB2, Accession NM_004442), a gene which Eph-related receptor tyrosine kinase B2; may have a role in neurogenesis. Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHB2. The function of EPHB2 and its association with various diseases and clinical conditions, has been established by previous studies,

as described hereinabove with reference to VGAM533.Leucine Zipper-EF-hand Containing Transmembrane Protein 1 (LETM1, Accession NM_012318) is another VGAM2031 host target gene. LETM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LETM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LETM1 BINDING SITE, designated SEQ ID:14695, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71220] Another function of VGAM2031 is therefore inhibition of Leucine Zipper-EF-hand Containing Transmembrane Protein 1 (LETM1, Accession NM_012318). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LETM1. Lysozyme (renal amyloidosis) (LYZ, Accession NM_000239) is another VGAM2031 host target gene. LYZ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LYZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LYZ BINDING SITE, designated SEQ ID:5759, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71221] Another function of VGAM2031 is therefore inhibition of Lysozyme (renal amyloidosis) (LYZ, Accession NM_000239), a gene which a bacteriolytic enzyme. Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LYZ. The function of LYZ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM929.Microtubule-associated Protein 1B (MAP1B, Accession NM_005909) is another VGAM2031 host target gene. MAP1B BINDING SITE1 and MAP1B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAP1B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP1B BINDING SITE1 and MAP1B BINDING SITE2, designated SEQ ID:12533 and SEQ ID:25711 respectively, to the nu-

cleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71222] Another function of VGAM2031 is therefore inhibition of Microtubule-associated Protein 1B (MAP1B, Accession NM_005909), a gene which may have a role in neuronal plasticity and brain development. Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP1B. The function of MAP1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM316.Phosphatidylinositol-4-phosphate 5-kinase, Type I, Alpha (PIP5K1A, Accession NM_003557) is another VGAM2031 host target gene. PIP5K1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIP5K1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP5K1A BINDING SITE, designated SEQ ID:9602, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71223] Another function of VGAM2031 is therefore inhibition of

Phosphatidylinositol-4-phosphate 5-kinase, Type I, Alpha (PIP5K1A, Accession NM_003557), a gene which is responsible for the synthesis of PtdIns(4,5)P2. Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K1A. The function of PIP5K1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM427.Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFBR2, Accession NM_003242) is another VGAM2031 host target gene. TGFBR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TGFBR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFBR2 BINDING SITE, designated SEQ ID:9245, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71224] Another function of VGAM2031 is therefore inhibition of Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFBR2, Accession NM_003242). Accordingly, utilities of

VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFBR2. Ubiquitin Specific Protease 6 (Tre-2 oncogene) (USP6, Accession XM_165948) is another VGAM2031 host target gene. USP6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by USP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP6 BINDING SITE, designated SEQ ID:43808, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71225] Another function of VGAM2031 is therefore inhibition of Ubiquitin Specific Protease 6 (Tre-2 oncogene) (USP6, Accession XM_165948), a gene which has an atp-independent isopeptidase activity, cleaving at the carboxyl terminus of the ubiquitin moiety. Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP6. The function of USP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM296.BTB (POZ) Domain Containing 2 (BTBD2, Accession NM_017797) is another VGAM2031 host target gene. BTBD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BTBD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTBD2 BINDING SITE, designated SEQ ID:19439, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71226] Another function of VGAM2031 is therefore inhibition of BTB (POZ) Domain Containing 2 (BTBD2, Accession NM_017797). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTBD2. Chromosome 20 Open Reading Frame 140 (C20orf140, Accession NM_144628) is another VGAM2031 host target gene. C20orf140 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of C20orf140 BINDING SITE, designated SEQ ID:29445, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71227] Another function of VGAM2031 is therefore inhibition of Chromosome 20 Open Reading Frame 140 (C20orf140, Accession NM_144628). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf140. C20orf183 (Accession NM_030776) is another VGAM2031 host target gene. C20orf183 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf183, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf183 BINDING SITE, designated SEQ ID:25061, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71228] Another function of VGAM2031 is therefore inhibition of C20orf183 (Accession NM_030776). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

C20orf183. DKFZp434F142 (Accession NM_032254) is another VGAM2031 host target gene. DKFZp434F142 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434F142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434F142 BINDING SITE, designated SEQ ID:25997, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71229] Another function of VGAM2031 is therefore inhibition of DKFZp434F142 (Accession NM_032254). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434F142. DKFZP434J193 (Accession XM_048452) is another VGAM2031 host target gene. DKFZP434J193 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434J193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434J193 BINDING SITE, des-

ignated SEQ ID:35163, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71230] Another function of VGAM2031 is therefore inhibition of DKFZP434J193 (Accession XM_048452). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434J193. DKFZP434L187 (Accession XM_044070) is another VGAM2031 host target gene. DKFZP434L187 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434L187, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434L187 BINDING SITE, designated SEQ ID:34119, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71231] Another function of VGAM2031 is therefore inhibition of DKFZP434L187 (Accession XM_044070). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434L187. DKFZP564C196 (Accession

XM_046405) is another VGAM2031 host target gene. DKFZP564C196 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564C196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564C196 BINDING SITE, designated SEQ ID:34709, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71232] Another function of VGAM2031 is therefore inhibition of DKFZP564C196 (Accession XM_046405). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564C196. Potassium Voltage-gated Channel, Shal-related Subfamily, Member 1 (KCND1, Accession NM_004979) is another VGAM2031 host target gene. KCND1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KCND1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCND1 BINDING SITE, designated SEQ

ID:11426, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71233] Another function of VGAM2031 is therefore inhibition of Potassium Voltage-gated Channel, Shal-related Subfamily, Member 1 (KCND1, Accession NM_004979). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCND1. KIAA0155 (Accession NM_014633) is another VGAM2031 host target gene. KIAA0155 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0155 BINDING SITE, designated SEQ ID:16003, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71234] Another function of VGAM2031 is therefore inhibition of KIAA0155 (Accession NM_014633). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0155. KIAA0169 (Accession XM_052725) is another

VGAM2031 host target gene. KIAA0169 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0169, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0169 BINDING SITE, designated SEQ ID:36052, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71235] Another function of VGAM2031 is therefore inhibition of KIAA0169 (Accession XM_052725). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0169. KIAA0441 (Accession NM_014797) is another VGAM2031 host target gene. KIAA0441 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0441 BINDING SITE, designated SEQ ID:16715, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71236] Another function of VGAM2031 is therefore inhibition of KIAA0441 (Accession NM_014797). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0441. KIAA0553 (Accession XM_045981) is another VGAM2031 host target gene. KIAA0553 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0553, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0553 BINDING SITE, designated SEQ ID:34635, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71237] Another function of VGAM2031 is therefore inhibition of KIAA0553 (Accession XM_045981). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0553. KIAA1075 (Accession XM_029631) is another VGAM2031 host target gene. KIAA1075 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1075, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1075 BINDING SITE, designated SEQ ID:30917, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71238] Another function of VGAM2031 is therefore inhibition of KIAA1075 (Accession XM_029631). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1075. KIAA1143 (Accession XM_044014) is another VGAM2031 host target gene. KIAA1143 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1143 BINDING SITE, designated SEQ ID:34073, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71239] Another function of VGAM2031 is therefore inhibition of KIAA1143 (Accession XM_044014). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1143. KIAA1280 (Accession XM_045766) is another VGAM2031 host target gene. KIAA1280 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1280, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1280 BINDING SITE, designated SEQ ID:34557, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71240] Another function of VGAM2031 is therefore inhibition of KIAA1280 (Accession XM_045766). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1280. KIAA1432 (Accession XM_039698) is another VGAM2031 host target gene. KIAA1432 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1432 BINDING SITE, designated SEQ ID:33159, to the nucleotide sequence of VGAM2031 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4742.

[71241] Another function of VGAM2031 is therefore inhibition of KIAA1432 (Accession XM_039698). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1432. KIAA1856 (Accession XM_166549) is another VGAM2031 host target gene. KIAA1856 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1856 BINDING SITE, designated SEQ ID:44523, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71242] Another function of VGAM2031 is therefore inhibition of KIAA1856 (Accession XM_166549). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1856. MGC15631 (Accession NM_032753) is another VGAM2031 host target gene. MGC15631 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC15631, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15631 BINDING SITE, designated SEQ ID:26490, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71243] Another function of VGAM2031 is therefore inhibition of MGC15631 (Accession NM_032753). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15631. NLI-IF (Accession NM_021198) is another VGAM2031 host target gene. NLI-IF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NLI-IF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NLI-IF BINDING SITE, designated SEQ ID:22172, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71244] Another function of VGAM2031 is therefore inhibition of NLI-IF (Accession NM_021198). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with NLI-IF. Ornithine Decarboxylase Antizyme 2 (OAZ2, Accession NM_002537) is another VGAM2031 host target gene. OAZ2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OAZ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OAZ2 BINDING SITE, designated SEQ ID:8375, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71245] Another function of VGAM2031 is therefore inhibition of Ornithine Decarboxylase Antizyme 2 (OAZ2, Accession NM_002537). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAZ2. PGR1 (Accession NM_033296) is another VGAM2031 host target gene. PGR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PGR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PGR1 BINDING SITE, designated SEQ ID:27123,

to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71246] Another function of VGAM2031 is therefore inhibition of PGR1 (Accession NM_033296). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PGR1. PRAX-1 (Accession NM_004758) is another VGAM2031 host target gene. PRAX-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRAX-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRAX-1 BINDING SITE, designated SEQ ID:11146, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71247] Another function of VGAM2031 is therefore inhibition of PRAX-1 (Accession NM_004758). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRAX-1. Polymerase I and Transcript Release Factor (PTRF, Accession XM_032852) is another VGAM2031 host target gene. PTRF BINDING SITE is HOST TARGET binding site

found in the 5` untranslated region of mRNA encoded by PTRF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTRF BINDING SITE, designated SEQ ID:31785, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71248] Another function of VGAM2031 is therefore inhibition of Polymerase I and Transcript Release Factor (PTRF, Accession XM_032852). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTRF. SCYD1 (Accession XM_165650) is another VGAM2031 host target gene. SCYD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCYD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYD1 BINDING SITE, designated SEQ ID:43712, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71249] Another function of VGAM2031 is therefore inhibition of

SCYD1 (Accession XM_165650). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYD1. LOC147093 (Accession XM_097184) is another VGAM2031 host target gene. LOC147093 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147093 BINDING SITE, designated SEQ ID:40798, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71250] Another function of VGAM2031 is therefore inhibition of LOC147093 (Accession XM_097184). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147093. LOC149132 (Accession XM_086428) is another VGAM2031 host target gene. LOC149132 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC149132 BINDING SITE, designated SEQ ID:38644, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71251] Another function of VGAM2031 is therefore inhibition of LOC149132 (Accession XM_086428). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149132. LOC201229 (Accession XM_113925) is another VGAM2031 host target gene. LOC201229 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201229 BINDING SITE, designated SEQ ID:42539, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71252] Another function of VGAM2031 is therefore inhibition of LOC201229 (Accession XM_113925). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201229. LOC203257 (Accession XM_113561) is an-

other VGAM2031 host target gene. LOC203257 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203257, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203257 BINDING SITE, designated SEQ ID:42286, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71253] Another function of VGAM2031 is therefore inhibition of LOC203257 (Accession XM_113561). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203257. LOC206426 (Accession XM_116505) is another VGAM2031 host target gene. LOC206426 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC206426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC206426 BINDING SITE, designated SEQ ID:43115, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71254] Another function of VGAM2031 is therefore inhibition of LOC206426 (Accession XM_116505). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC206426. LOC91040 (Accession XM_035641) is another VGAM2031 host target gene. LOC91040 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91040 BINDING SITE, designated SEQ ID:32311, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71255] Another function of VGAM2031 is therefore inhibition of LOC91040 (Accession XM_035641). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91040. LOC91409 (Accession XM_038298) is another VGAM2031 host target gene. LOC91409 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91409, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91409 BINDING SITE, designated SEQ ID:32803, to the nucleotide sequence of VGAM2031 RNA, herein designated VGAM RNA, also designated SEQ ID:4742.

[71256] Another function of VGAM2031 is therefore inhibition of LOC91409 (Accession XM_038298). Accordingly, utilities of VGAM2031 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91409. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2032 (VGAM2032) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71257] VGAM2032 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2032 was detected is described hereinabove with reference to Figs. 1-8.

[71258] VGAM2032 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Kyuri Green Mottle Mosaic Virus. VGAM2032 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71259] VGAM2032 gene encodes a VGAM2032 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2032 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2032 precursor RNA is designated SEQ ID:2018, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2018 is located at position 2336 relative to the genome of Kyuri Green Mottle Mosaic Virus.

[71260] VGAM2032 precursor RNA folds onto itself, forming VGAM2032 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71261] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2032 folded precursor RNA into VGAM2032

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2032 RNA is designated SEQ ID:4743, and is provided hereinbelow with reference to the sequence listing part.

[71262] VGAM2032 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2032 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2032 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71263] VGAM2032 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2032 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2032 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2032 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2032 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71264] The complementary binding of VGAM2032 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2032 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2032 host target RNA into VGAM2032 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[71265] It is appreciated that VGAM2032 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2032 host target genes. The mRNA of each one of this plurality of VGAM2032 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2032 RNA, herein designated VGAM RNA, and which when bound by VGAM2032 RNA causes inhibition of translation of respective one or more VGAM2032 host target proteins.

[71266] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2032 gene, herein designated VGAM GENE, on one or more VGAM2032 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71267] It is yet further appreciated that a function of VGAM2032 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2032 include diagnosis, prevention and treatment of viral infection by Kyuri Green Mottle Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2032 correlate with, and may be deduced from, the identity of the host target genes which VGAM2032 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71268] Nucleotide sequences of the VGAM2032 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2032 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2032 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2032 are further described hereinbelow with reference to Table 1.

[71269] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2032 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2032 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71270] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2032 gene, herein designated VGAM is inhibition of expression of VGAM2032 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2032 correlate with, and may be deduced from, the identity of the target genes which VGAM2032 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71271] FLJ20298 (Accession NM_017752) is a VGAM2032 host target gene. FLJ20298 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20298, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20298 BINDING SITE, designated SEQ ID:19362, to the nucleotide sequence of VGAM2032 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4743.

[71272] A function of VGAM2032 is therefore inhibition of FLJ20298 (Accession NM_017752). Accordingly, utilities of VGAM2032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20298. LOC201695 (Accession XM_120432) is another VGAM2032 host target gene. LOC201695 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201695, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201695 BINDING SITE, designated SEQ ID:43609, to the nucleotide sequence of VGAM2032 RNA, herein designated VGAM RNA, also designated SEQ ID:4743.

[71273] Another function of VGAM2032 is therefore inhibition of LOC201695 (Accession XM_120432). Accordingly, utilities of VGAM2032 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201695. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2033 (VGAM2033) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71274] VGAM2033 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2033 was detected is described hereinabove with reference to Figs. 1-8.

[71275] VGAM2033 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zaire Ebola Virus (ZEBOV). VGAM2033 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71276] VGAM2033 gene encodes a VGAM2033 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2033 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2033 precursor RNA is designated SEQ ID:2019, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2019 is located at position 4726 relative to the genome of Zaire Ebola Virus (ZEBOV).

[71277] VGAM2033 precursor RNA folds onto itself, forming

VGAM2033 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71278] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2033 folded precursor RNA into VGAM2033 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2033 RNA is designated SEQ ID:4744, and is provided hereinbelow with reference to the sequence listing part.

[71279] VGAM2033 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2033 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2033 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71280] VGAM2033 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2033 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2033 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2033 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2033 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71281] The complementary binding of VGAM2033 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2033 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2033 host target RNA into VGAM2033 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71282] It is appreciated that VGAM2033 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2033 host target genes. The mRNA of each one of this plurality of VGAM2033 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2033 RNA, herein designated VGAM RNA, and which when bound by VGAM2033 RNA causes inhibition of translation of respective one or more VGAM2033 host target proteins.

[71283] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2033 gene, herein designated VGAM GENE, on one or more VGAM2033 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71284] It is yet further appreciated that a function of VGAM2033 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2033 include diagnosis, prevention and treatment of viral infection by Zaire Ebola Virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2033 correlate with, and may be deduced from, the identity of the host target genes which VGAM2033 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[71285] Nucleotide sequences of the VGAM2033 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2033 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2033 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2033 are further described hereinbelow with reference to Table 1.

[71286] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2033 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2033 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71287] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2033 gene, herein designated VGAM is inhibition of expression of VGAM2033 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2033 correlate with, and may be deduced from, the identity of the target genes which VGAM2033 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[71288] KIAA1219 (Accession XM_028835) is a VGAM2033 host target gene. KIAA1219 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1219 BINDING SITE, designated SEQ ID:30759, to the nucleotide sequence of VGAM2033 RNA, herein designated VGAM RNA, also designated SEQ ID:4744.

[71289] A function of VGAM2033 is therefore inhibition of KIAA1219 (Accession XM_028835). Accordingly, utilities of VGAM2033 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1219. KIAA1822 (Accession XM_041566) is another VGAM2033 host target gene. KIAA1822 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1822, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1822 BINDING SITE, designated SEQ ID:33549, to the

nucleotide sequence of VGAM2033 RNA, herein designated VGAM RNA, also designated SEQ ID:4744.

[71290] Another function of VGAM2033 is therefore inhibition of KIAA1822 (Accession XM_041566). Accordingly, utilities of VGAM2033 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1822. MKP-7 (Accession XM_039106) is another VGAM2033 host target gene. MKP-7 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MKP-7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKP-7 BINDING SITE, designated SEQ ID:33004, to the nucleotide sequence of VGAM2033 RNA, herein designated VGAM RNA, also designated SEQ ID:4744.

[71291] Another function of VGAM2033 is therefore inhibition of MKP-7 (Accession XM_039106). Accordingly, utilities of VGAM2033 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKP-7. LOC199858 (Accession XM_114040) is another VGAM2033 host target gene. LOC199858 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by LOC199858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199858 BINDING SITE, designated SEQ ID:42634, to the nucleotide sequence of VGAM2033 RNA, herein designated VGAM RNA, also designated SEQ ID:4744.

[71292] Another function of VGAM2033 is therefore inhibition of LOC199858 (Accession XM_114040). Accordingly, utilities of VGAM2033 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199858. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2034 (VGAM2034) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71293] VGAM2034 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2034 was detected is described hereinabove with reference to Figs. 1-8.

[71294] VGAM2034 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Kyuri Green Mottle Mosaic Virus. VGAM2034 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71295] VGAM2034 gene encodes a VGAM2034 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2034 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2034 precursor RNA is designated SEQ ID:2020, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2020 is located at position 3084 relative to the genome of Kyuri Green Mottle Mosaic Virus.

[71296] VGAM2034 precursor RNA folds onto itself, forming VGAM2034 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71297] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2034 folded precursor RNA into VGAM2034 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2034 RNA is designated SEQ ID:4745, and is provided hereinbelow with reference to the sequence listing part.

[71298] VGAM2034 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2034 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2034 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71299] VGAM2034 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2034 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2034 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2034 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2034 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71300] The complementary binding of VGAM2034 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2034 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2034

host target RNA into VGAM2034 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71301] It is appreciated that VGAM2034 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2034 host target genes. The mRNA of each one of this plurality of VGAM2034 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2034 RNA, herein designated VGAM RNA, and which when bound by VGAM2034 RNA causes inhibition of translation of respective one or more VGAM2034 host target proteins.

[71302] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2034 gene, herein designated VGAM GENE, on one or more VGAM2034 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71303] It is yet further appreciated that a function of VGAM2034 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2034 include diagnosis, prevention and treatment of viral infection by Kyuri Green Mottle Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2034 correlate with, and may be deduced from, the identity of the host target genes which VGAM2034 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71304] Nucleotide sequences of the VGAM2034 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2034 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2034 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2034 are further

described hereinbelow with reference to Table 1.

[71305] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2034 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2034 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71306] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2034 gene, herein designated VGAM is inhibition of expression of VGAM2034 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2034 correlate with, and may be deduced from, the identity of the target genes which VGAM2034 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71307] C-reactive Protein, Pentraxin-related (CRP, Accession XM_049673) is a VGAM2034 host target gene. CRP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRP

BINDING SITE, designated SEQ ID:35464, to the nucleotide sequence of VGAM2034 RNA, herein designated VGAM RNA, also designated SEQ ID:4745.

[71308] A function of VGAM2034 is therefore inhibition of C-reactive Protein, Pentraxin-related (CRP, Accession XM_049673). Accordingly, utilities of VGAM2034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRP. Huntingtin (Huntington disease) (HD, Accession NM_002111) is another VGAM2034 host target gene. HD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HD BINDING SITE, designated SEQ ID:7898, to the nucleotide sequence of VGAM2034 RNA, herein designated VGAM RNA, also designated SEQ ID:4745.

[71309] Another function of VGAM2034 is therefore inhibition of Huntingtin (Huntington disease) (HD, Accession NM_002111). Accordingly, utilities of VGAM2034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HD. LAPTM5 (Accession

NM_006762) is another VGAM2034 host target gene. LAPTM5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LAPTM5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAPTM5 BINDING SITE, designated SEQ ID:13618, to the nucleotide sequence of VGAM2034 RNA, herein designated VGAM RNA, also designated SEQ ID:4745.

[71310] Another function of VGAM2034 is therefore inhibition of LAPTM5 (Accession NM_006762). Accordingly, utilities of VGAM2034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAPTM5. Non-POU Domain Containing, Octamer-binding (NONO, Accession XM_088688) is another VGAM2034 host target gene. NONO BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NONO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NONO BINDING SITE, designated SEQ ID:39901, to the nucleotide sequence of

VGAM2034 RNA, herein designated VGAM RNA, also designated SEQ ID:4745.

[71311] Another function of VGAM2034 is therefore inhibition of Non-POU Domain Containing, Octamer-binding (NONO, Accession XM_088688), a gene which is a nuclear protein which contains RNA recognition motifs. Accordingly, utilities of VGAM2034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NONO. The function of NONO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95.Proprotein Convertase Subtilisin/kexin Type 1 (PCSK1, Accession NM_000439) is another VGAM2034 host target gene. PCSK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCSK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCSK1 BINDING SITE, designated SEQ ID:6024, to the nucleotide sequence of VGAM2034 RNA, herein designated VGAM RNA, also designated SEQ ID:4745.

[71312] Another function of VGAM2034 is therefore inhibition of

Proprotein Convertase Subtilisin/kexin Type 1 (PCSK1, Accession NM_000439), a gene which processes hormone precursors by cleaving paired basic amino acids; serine protease of the subtilase family. Accordingly, utilities of VGAM2034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCSK1. The function of PCSK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1398.APELIN (Accession NM_017413) is another VGAM2034 host target gene. APELIN BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by APELIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APELIN BINDING SITE, designated SEQ ID:18872, to the nucleotide sequence of VGAM2034 RNA, herein designated VGAM RNA, also designated SEQ ID:4745.

[71313] Another function of VGAM2034 is therefore inhibition of APELIN (Accession NM_017413). Accordingly, utilities of VGAM2034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APELIN.

Apoptosis Inhibitor 5 (API5, Accession NM_006595) is another VGAM2034 host target gene. API5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by API5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of API5 BINDING SITE, designated SEQ ID:13363, to the nucleotide sequence of VGAM2034 RNA, herein designated VGAM RNA, also designated SEQ ID:4745.

[71314] Another function of VGAM2034 is therefore inhibition of Apoptosis Inhibitor 5 (API5, Accession NM_006595). Accordingly, utilities of VGAM2034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with API5. FLJ20979 (Accession NM_024121) is another VGAM2034 host target gene. FLJ20979 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20979 BINDING SITE, designated SEQ ID:23575, to the nucleotide sequence of VGAM2034 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4745.

[71315] Another function of VGAM2034 is therefore inhibition of FLJ20979 (Accession NM_024121). Accordingly, utilities of VGAM2034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20979. KIAA0441 (Accession NM_014797) is another VGAM2034 host target gene. KIAA0441 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0441 BINDING SITE, designated SEQ ID:16711, to the nucleotide sequence of VGAM2034 RNA, herein designated VGAM RNA, also designated SEQ ID:4745.

[71316] Another function of VGAM2034 is therefore inhibition of KIAA0441 (Accession NM_014797). Accordingly, utilities of VGAM2034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0441. MGC15437 (Accession NM_032873) is another VGAM2034 host target gene. MGC15437 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC15437, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15437 BINDING SITE, designated SEQ ID:26691, to the nucleotide sequence of VGAM2034 RNA, herein designated VGAM RNA, also designated SEQ ID:4745.

[71317] Another function of VGAM2034 is therefore inhibition of MGC15437 (Accession NM_032873). Accordingly, utilities of VGAM2034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15437. LOC144079 (Accession XM_084711) is another VGAM2034 host target gene. LOC144079 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144079, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144079 BINDING SITE, designated SEQ ID:37673, to the nucleotide sequence of VGAM2034 RNA, herein designated VGAM RNA, also designated SEQ ID:4745.

[71318] Another function of VGAM2034 is therefore inhibition of LOC144079 (Accession XM_084711). Accordingly, utilities of VGAM2034 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC144079. LOC146455 (Accession XM_085471) is another VGAM2034 host target gene. LOC146455 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146455, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146455 BINDING SITE, designated SEQ ID:38160, to the nucleotide sequence of VGAM2034 RNA, herein designated VGAM RNA, also designated SEQ ID:4745.

[71319] Another function of VGAM2034 is therefore inhibition of LOC146455 (Accession XM_085471). Accordingly, utilities of VGAM2034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146455. LOC152762 (Accession XM_087518) is another VGAM2034 host target gene. LOC152762 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152762, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152762 BINDING SITE, designated SEQ ID:39307, to

the nucleotide sequence of VGAM2034 RNA, herein designated VGAM RNA, also designated SEQ ID:4745.

[71320] Another function of VGAM2034 is therefore inhibition of LOC152762 (Accession XM_087518). Accordingly, utilities of VGAM2034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152762. LOC153196 (Accession XM_098323) is another VGAM2034 host target gene. LOC153196 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153196 BINDING SITE, designated SEQ ID:41591, to the nucleotide sequence of VGAM2034 RNA, herein designated VGAM RNA, also designated SEQ ID:4745.

[71321] Another function of VGAM2034 is therefore inhibition of LOC153196 (Accession XM_098323). Accordingly, utilities of VGAM2034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153196. LOC153505 (Accession XM_087693) is another VGAM2034 host target gene. LOC153505 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC153505, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153505 BINDING SITE, designated SEQ ID:39384, to the nucleotide sequence of VGAM2034 RNA, herein designated VGAM RNA, also designated SEQ ID:4745.

[71322] Another function of VGAM2034 is therefore inhibition of LOC153505 (Accession XM_087693). Accordingly, utilities of VGAM2034 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153505. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2035 (VGAM2035) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71323] VGAM2035 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2035 was detected is described hereinabove with reference to Figs. 1-8.

[71324] VGAM2035 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Zaire Ebola Virus (ZEBOV). VGAM2035 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71325] VGAM2035 gene encodes a VGAM2035 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2035 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2035 precursor RNA is designated SEQ ID:2021, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2021 is located at position 12837 relative to the genome of Zaire Ebola Virus (ZEBOV).

[71326] VGAM2035 precursor RNA folds onto itself, forming VGAM2035 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71327] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2035 folded precursor RNA into VGAM2035 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM2035 RNA is designated SEQ ID:4746, and is provided hereinbelow with reference to the sequence listing part.

[71328] VGAM2035 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2035 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2035 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71329] VGAM2035 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2035 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2035 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2035 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2035 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71330] The complementary binding of VGAM2035 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2035 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2035

host target RNA into VGAM2035 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71331] It is appreciated that VGAM2035 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2035 host target genes. The mRNA of each one of this plurality of VGAM2035 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2035 RNA, herein designated VGAM RNA, and which when bound by VGAM2035 RNA causes inhibition of translation of respective one or more VGAM2035 host target proteins.

[71332] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2035 gene, herein designated VGAM GENE, on one or more VGAM2035 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71333] It is yet further appreciated that a function of VGAM2035 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2035 include diagnosis, prevention and treatment of viral infection by Zaire Ebola Virus (ZEBOV). Specific functions, and accordingly utilities, of VGAM2035 correlate with, and may be deduced from, the identity of the host target genes which VGAM2035 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71334] Nucleotide sequences of the VGAM2035 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2035 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2035 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2035 are further

described hereinbelow with reference to Table 1.

[71335] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2035 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2035 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71336] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2035 gene, herein designated VGAM is inhibition of expression of VGAM2035 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2035 correlate with, and may be deduced from, the identity of the target genes which VGAM2035 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71337] Activating Transcription Factor 5 (ATF5, Accession NM_012068) is a VGAM2035 host target gene. ATF5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ATF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

ATF5 BINDING SITE, designated SEQ ID:14319, to the nucleotide sequence of VGAM2035 RNA, herein designated VGAM RNA, also designated SEQ ID:4746.

[71338] A function of VGAM2035 is therefore inhibition of Activating Transcription Factor 5 (ATF5, Accession NM_012068), a gene which binds to cAMP-inducible promoters and is involved in gene transcription. Accordingly, utilities of VGAM2035 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATF5. The function of ATF5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM588.Interleukin 8 Receptor, Alpha (IL8RA, Accession NM_000634) is another VGAM2035 host target gene. IL8RA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL8RA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL8RA BINDING SITE, designated SEQ ID:6265, to the nucleotide sequence of VGAM2035 RNA, herein designated VGAM RNA, also designated SEQ ID:4746.

[71339] Another function of VGAM2035 is therefore inhibition of

Interleukin 8 Receptor, Alpha (IL8RA, Accession NM_000634), a gene which is the receptor to interleukin-8, which is a powerful neutrophils chemotactic factor. Accordingly, utilities of VGAM2035 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL8RA. The function of IL8RA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM300.Paraoxonase 1 (PON1, Accession NM_000446) is another VGAM2035 host target gene. PON1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PON1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PON1 BINDING SITE, designated SEQ ID:6032, to the nucleotide sequence of VGAM2035 RNA, herein designated VGAM RNA, also designated SEQ ID:4746.

[71340] Another function of VGAM2035 is therefore inhibition of Paraoxonase 1 (PON1, Accession NM_000446), a gene which hydrolyzes the toxic metabolites of a variety of organophosphorus insecticides. Accordingly, utilities of VGAM2035 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with PON1. The function of PON1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1956.SH3-domain Binding Protein 4 (SH3BP4, Accession NM_014521) is another VGAM2035 host target gene. SH3BP4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SH3BP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BP4 BINDING SITE, designated SEQ ID:15853, to the nucleotide sequence of VGAM2035 RNA, herein designated VGAM RNA, also designated SEQ ID:4746.

[71341] Another function of VGAM2035 is therefore inhibition of SH3-domain Binding Protein 4 (SH3BP4, Accession NM_014521), a gene which is of unknown function, contains SH3-domain binding protein 4; similar to the EH-binding protein. Accordingly, utilities of VGAM2035 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BP4. The function of SH3BP4 and its association with various diseases and

clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179.FLJ10540 (Accession NM_018131) is another VGAM2035 host target gene. FLJ10540 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10540, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10540 BINDING SITE, designated SEQ ID:19926, to the nucleotide sequence of VGAM2035 RNA, herein designated VGAM RNA, also designated SEQ ID:4746.

[71342] Another function of VGAM2035 is therefore inhibition of FLJ10540 (Accession NM_018131). Accordingly, utilities of VGAM2035 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10540. FLJ11370 (Accession NM_024961) is another VGAM2035 host target gene. FLJ11370 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11370, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11370

BINDING SITE, designated SEQ ID:24516, to the nucleotide sequence of VGAM2035 RNA, herein designated VGAM RNA, also designated SEQ ID:4746.

[71343] Another function of VGAM2035 is therefore inhibition of FLJ11370 (Accession NM_024961). Accordingly, utilities of VGAM2035 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11370. FLJ21272 (Accession NM_025032) is another VGAM2035 host target gene. FLJ21272 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21272, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21272 BINDING SITE, designated SEQ ID:24630, to the nucleotide sequence of VGAM2035 RNA, herein designated VGAM RNA, also designated SEQ ID:4746.

[71344] Another function of VGAM2035 is therefore inhibition of FLJ21272 (Accession NM_025032). Accordingly, utilities of VGAM2035 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21272. HSMPP8 (Accession XM_167894) is another VGAM2035 host target gene. HSMPP8 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSMPP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSMPP8 BINDING SITE, designated SEQ ID:44903, to the nucleotide sequence of VGAM2035 RNA, herein designated VGAM RNA, also designated SEQ ID:4746.

[71345] Another function of VGAM2035 is therefore inhibition of HSMPP8 (Accession XM_167894). Accordingly, utilities of VGAM2035 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSMPP8. KIAA0431 (Accession NM_015251) is another VGAM2035 host target gene. KIAA0431 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0431 BINDING SITE, designated SEQ ID:17578, to the nucleotide sequence of VGAM2035 RNA, herein designated VGAM RNA, also designated SEQ ID:4746.

[71346] Another function of VGAM2035 is therefore inhibition of KIAA0431 (Accession NM_015251). Accordingly, utilities of VGAM2035 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0431. KIAA0562 (Accession NM_014704) is another VGAM2035 host target gene. KIAA0562 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0562 BINDING SITE, designated SEQ ID:16241, to the nucleotide sequence of VGAM2035 RNA, herein designated VGAM RNA, also designated SEQ ID:4746.

[71347] Another function of VGAM2035 is therefore inhibition of KIAA0562 (Accession NM_014704). Accordingly, utilities of VGAM2035 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0562. KIAA1789 (Accession XM_040486) is another VGAM2035 host target gene. KIAA1789 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1789, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1789 BINDING SITE, designated SEQ ID:33308, to the nucleotide sequence of VGAM2035 RNA, herein designated VGAM RNA, also designated SEQ ID:4746.

[71348] Another function of VGAM2035 is therefore inhibition of KIAA1789 (Accession XM_040486). Accordingly, utilities of VGAM2035 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1789. LIN-7-C (Accession NM_018362) is another VGAM2035 host target gene. LIN-7-C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LIN-7-C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIN-7-C BINDING SITE, designated SEQ ID:20371, to the nucleotide sequence of VGAM2035 RNA, herein designated VGAM RNA, also designated SEQ ID:4746.

[71349] Another function of VGAM2035 is therefore inhibition of LIN-7-C (Accession NM_018362). Accordingly, utilities of VGAM2035 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIN-

7-C. LOC119504 (Accession XM_058400) is another VGAM2035 host target gene. LOC119504 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC119504, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC119504 BINDING SITE, designated SEQ ID:36615, to the nucleotide sequence of VGAM2035 RNA, herein designated VGAM RNA, also designated SEQ ID:4746.

[71350] Another function of VGAM2035 is therefore inhibition of LOC119504 (Accession XM_058400). Accordingly, utilities of VGAM2035 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC119504. LOC145547 (Accession XM_085167) is another VGAM2035 host target gene. LOC145547 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145547, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145547 BINDING SITE, designated SEQ ID:37895, to the nucleotide sequence of VGAM2035 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4746.

[71351] Another function of VGAM2035 is therefore inhibition of LOC145547 (Accession XM_085167). Accordingly, utilities of VGAM2035 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145547. LOC203339 (Accession XM_117534) is another VGAM2035 host target gene. LOC203339 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203339, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203339 BINDING SITE, designated SEQ ID:43525, to the nucleotide sequence of VGAM2035 RNA, herein designated VGAM RNA, also designated SEQ ID:4746.

[71352] Another function of VGAM2035 is therefore inhibition of LOC203339 (Accession XM_117534). Accordingly, utilities of VGAM2035 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203339. LOC253128 (Accession XM_170726) is another VGAM2035 host target gene. LOC253128 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253128, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253128 BINDING SITE, designated SEQ ID:45487, to the nucleotide sequence of VGAM2035 RNA, herein designated VGAM RNA, also designated SEQ ID:4746.

[71353] Another function of VGAM2035 is therefore inhibition of LOC253128 (Accession XM_170726). Accordingly, utilities of VGAM2035 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253128. LOC254065 (Accession XM_173239) is another VGAM2035 host target gene. LOC254065 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254065, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254065 BINDING SITE, designated SEQ ID:46523, to the nucleotide sequence of VGAM2035 RNA, herein designated VGAM RNA, also designated SEQ ID:4746.

[71354] Another function of VGAM2035 is therefore inhibition of LOC254065 (Accession XM_173239). Accordingly, utilities of VGAM2035 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC254065. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2036 (VGAM2036) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71355] VGAM2036 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2036 was detected is described hereinabove with reference to Figs. 1-8.

[71356] VGAM2036 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Marburg Virus. VGAM2036 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71357] VGAM2036 gene encodes a VGAM2036 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2036 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2036 precursor RNA is desig-

nated SEQ ID:2022, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2022 is located at position 4709 relative to the genome of Marburg Virus.

[71358] VGAM2036 precursor RNA folds onto itself, forming VGAM2036 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71359] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2036 folded precursor RNA into VGAM2036 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2036 RNA is designated SEQ ID:4747, and is provided hereinbelow with reference to the sequence

listing part.

[71360] VGAM2036 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2036 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2036 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71361] VGAM2036 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2036 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2036 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2036 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2036 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71362] The complementary binding of VGAM2036 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2036 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2036 host target RNA into VGAM2036 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71363] It is appreciated that VGAM2036 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2036 host target genes. The mRNA of each one of this plurality of VGAM2036 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2036 RNA, herein designated VGAM

RNA, and which when bound by VGAM2036 RNA causes inhibition of translation of respective one or more VGAM2036 host target proteins.

[71364] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2036 gene, herein designated VGAM GENE, on one or more VGAM2036 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71365] It is yet further appreciated that a function of VGAM2036 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2036 include diagnosis, prevention and treatment of viral infection by Marburg Virus. Specific functions, and accordingly utilities, of VGAM2036 correlate with, and may be deduced from, the identity of the host target genes which VGAM2036 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71366] Nucleotide sequences of the VGAM2036 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2036 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2036 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2036 are further described hereinbelow with reference to Table 1.

[71367] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2036 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2036 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71368] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2036 gene, herein designated VGAM is

inhibition of expression of VGAM2036 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2036 correlate with, and may be deduced from, the identity of the target genes which VGAM2036 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71369] Death-associated Protein (DAP, Accession XM_051902) is a VGAM2036 host target gene. DAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAP BINDING SITE, designated SEQ ID:35915, to the nucleotide sequence of VGAM2036 RNA, herein designated VGAM RNA, also designated SEQ ID:4747.

[71370] A function of VGAM2036 is therefore inhibition of Death-associated Protein (DAP, Accession XM_051902), a gene which mediates in programmed cell death . Accordingly, utilities of VGAM2036 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAP. The function of DAP has been established by previous studies. Deiss et al. (1995) reported that

gamma-interferon (OMIM Ref. No. 147570) induced in HeLa cells a type of death that had cytologic characteristics of programmed cell death. In this system, they identified 2 novel genes whose expression was indispensable for the execution of this type of cell death. The rescue was based on positive growth selection of cells after transfection with antisense cDNA expression libraries. The antisense RNA-mediated inactivation of the 2 novel genes protected the cells from the IFNG-induced cell death, but not from the cytostatic effects of the cytokine or from a necrotic type of cell death. One of these genes was death-associated protein kinase-1 (OMIM Ref. No. 600831). The other, designated death-associated protein (DAP), was expressed as a single 2.4-kb mRNA that encodes a basic, proline-rich, 15-kD protein. The expression levels of the 2 proteins were selectively reduced by the corresponding antisense RNAs. The authors suggested that these 2 novel genes are candidates for positive mediators of programmed cell death that is induced by interferon-gamma. By analysis of rodent-human somatic cell hybrids, Feinstein et al. (1995) found that DAP is located on chromosome 5p15.2 in a region just centromeric to that to which the cri-du-chat syndrome (OMIM Ref. No. 123450) has

been mapped

[71371] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[71372] Deiss, L. P.; Feinstein, E.; Berissi, H.; Cohen, O.; Kimchi, A. : Identification of a novel serine/threonine kinase and a novel 15-kD protein as potential mediators of the gamma interferon-induced cell death. Genes Dev. 9: 15-30, 1995. ; and

[71373] Feinstein, E.; Druck, T.; Kastury, K.; Berissi, H.; Goodart, S. A.; Overhauser, J.; Kimchi, A.; Huebner, K. : Assignment of DAP1 and DAPK: genes that positively mediate pro-grammed cell.

[71374] Further studies establishing the function and utilities of DAP are found in John Hopkins OMIM database record ID 600954, and in sited publications numbered 8217-8218 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Zinc Finger Protein 256 (ZNF256, Accession NM_005773) is another VGAM2036 host target gene. ZNF256 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF256, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF256 BINDING SITE, designated SEQ ID:12346, to the nucleotide sequence of VGAM2036 RNA, herein designated VGAM RNA, also designated SEQ ID:4747.

[71375] Another function of VGAM2036 is therefore inhibition of Zinc Finger Protein 256 (ZNF256, Accession NM_005773). Accordingly, utilities of VGAM2036 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF256. KIAA1843 (Accession XM_030838) is another VGAM2036 host target gene. KIAA1843 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1843, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1843 BINDING SITE, designated SEQ ID:31161, to the nucleotide sequence of VGAM2036 RNA, herein designated VGAM RNA, also designated SEQ ID:4747.

[71376] Another function of VGAM2036 is therefore inhibition of KIAA1843 (Accession XM_030838). Accordingly, utilities of VGAM2036 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1843. PRO0456 (Accession NM_014127) is another VGAM2036 host target gene. PRO0456 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO0456, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0456 BINDING SITE, designated SEQ ID:15393, to the nucleotide sequence of VGAM2036 RNA, herein designated VGAM RNA, also designated SEQ ID:4747.

[71377] Another function of VGAM2036 is therefore inhibition of PRO0456 (Accession NM_014127). Accordingly, utilities of VGAM2036 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0456. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2037 (VGAM2037) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71378] VGAM2037 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2037 was detected is described hereinabove with reference to Figs. 1-8.

[71379] VGAM2037 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Marburg Virus. VGAM2037 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71380] VGAM2037 gene encodes a VGAM2037 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2037 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2037 precursor RNA is designated SEQ ID:2023, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2023 is located at position 17431 relative to the genome of Marburg Virus.

[71381] VGAM2037 precursor RNA folds onto itself, forming VGAM2037 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71382] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2037 folded precursor RNA into VGAM2037 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2037 RNA is designated SEQ ID:4748, and is provided hereinbelow with reference to the sequence listing part.

[71383] VGAM2037 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2037 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2037 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71384] VGAM2037 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2037 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2037 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2037 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2037 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71385] The complementary binding of VGAM2037 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2037 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2037 host target RNA into VGAM2037 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71386] It is appreciated that VGAM2037 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2037 host target genes. The mRNA of each one of this plurality of VGAM2037 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2037 RNA, herein designated VGAM RNA, and which when bound by VGAM2037 RNA causes inhibition of translation of respective one or more VGAM2037 host target proteins.

[71387] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2037 gene, herein designated VGAM GENE, on one or more VGAM2037 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71388] It is yet further appreciated that a function of VGAM2037 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2037 include diagnosis, prevention and treatment of viral infection by Marburg Virus. Specific functions, and accordingly utilities, of VGAM2037 correlate with, and may be deduced from, the identity of the host target genes which VGAM2037 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71389] Nucleotide sequences of the VGAM2037 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2037 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2037 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2037 are further described hereinbelow with reference to Table 1.

[71390] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2037 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2037 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71391] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2037 gene, herein designated VGAM is inhibition of expression of VGAM2037 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2037 correlate with, and may be deduced from, the identity of the target genes which VGAM2037 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71392] FLJ20449 (Accession NM_017826) is a VGAM2037 host target gene. FLJ20449 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by FLJ20449, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20449 BINDING SITE, designated SEQ ID:19486, to the nucleotide sequence of VGAM2037 RNA, herein designated VGAM RNA, also designated SEQ ID:4748.

[71393] A function of VGAM2037 is therefore inhibition of FLJ20449 (Accession NM_017826). Accordingly, utilities of VGAM2037 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20449. FLJ21044 (Accession NM_022370) is another VGAM2037 host target gene. FLJ21044 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ21044, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21044 BINDING SITE, designated SEQ ID:22759, to the nucleotide sequence of VGAM2037 RNA, herein designated VGAM RNA, also designated SEQ ID:4748.

[71394] Another function of VGAM2037 is therefore inhibition of FLJ21044 (Accession NM_022370). Accordingly, utilities of

VGAM2037 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21044. KIAA0354 (Accession NM_014872) is another VGAM2037 host target gene. KIAA0354 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0354, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0354 BINDING SITE, designated SEQ ID:16996, to the nucleotide sequence of VGAM2037 RNA, herein designated VGAM RNA, also designated SEQ ID:4748.

[71395] Another function of VGAM2037 is therefore inhibition of KIAA0354 (Accession NM_014872). Accordingly, utilities of VGAM2037 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0354. KIAA0534 (Accession XM_049349) is another VGAM2037 host target gene. KIAA0534 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0534 BINDING SITE, designated SEQ ID:35378, to the nucleotide sequence of VGAM2037 RNA, herein designated VGAM RNA, also designated SEQ ID:4748.

[71396] Another function of VGAM2037 is therefore inhibition of KIAA0534 (Accession XM_049349). Accordingly, utilities of VGAM2037 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0534. KIAA0825 (Accession XM_027906) is another VGAM2037 host target gene. KIAA0825 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0825, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0825 BINDING SITE, designated SEQ ID:30591, to the nucleotide sequence of VGAM2037 RNA, herein designated VGAM RNA, also designated SEQ ID:4748.

[71397] Another function of VGAM2037 is therefore inhibition of KIAA0825 (Accession XM_027906). Accordingly, utilities of VGAM2037 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0825. LOC115207 (Accession NM_138444) is another VGAM2037 host target gene. LOC115207 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115207, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115207 BINDING SITE, designated SEQ ID:28808, to the nucleotide sequence of VGAM2037 RNA, herein designated VGAM RNA, also designated SEQ ID:4748.

[71398] Another function of VGAM2037 is therefore inhibition of LOC115207 (Accession NM_138444). Accordingly, utilities of VGAM2037 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115207. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2038 (VGAM2038) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71399] VGAM2038 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2038 was detected is described hereinabove with reference to Figs. 1-8.

[71400] VGAM2038 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Kyuri Green Mottle Mosaic Virus. VGAM2038 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71401] VGAM2038 gene encodes a VGAM2038 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2038 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2038 precursor RNA is designated SEQ ID:2024, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2024 is located at position 2310 relative to the genome of Kyuri Green Mottle Mosaic Virus.

[71402] VGAM2038 precursor RNA folds onto itself, forming VGAM2038 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[71403] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2038 folded precursor RNA into VGAM2038 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2038 RNA is designated SEQ ID:4749, and is provided hereinbelow with reference to the sequence listing part.

[71404] VGAM2038 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2038 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2038 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71405] VGAM2038 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2038 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2038 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2038 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2038 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71406] The complementary binding of VGAM2038 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2038 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2038 host target RNA into VGAM2038 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71407] It is appreciated that VGAM2038 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2038 host target genes. The mRNA of each one of this plurality of VGAM2038 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2038 RNA, herein designated VGAM RNA, and which when bound by VGAM2038 RNA causes inhibition of translation of respective one or more VGAM2038 host target proteins.

[71408] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2038 gene, herein designated VGAM GENE, on one or more VGAM2038 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71409] It is yet further appreciated that a function of VGAM2038 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2038 include diagnosis, prevention and treatment of viral infection by Kyuri Green Mottle Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2038 correlate with, and may be deduced from, the identity of the host target genes which VGAM2038 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71410] Nucleotide sequences of the VGAM2038 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2038 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2038 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2038 are further described hereinbelow with reference to Table 1.

[71411] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2038 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2038 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71412] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2038 gene, herein designated VGAM is inhibition of expression of VGAM2038 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2038 correlate with, and may be deduced from, the identity of the target genes which VGAM2038 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71413] FLJ20298 (Accession NM_017752) is a VGAM2038 host target gene. FLJ20298 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20298, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ20298 BINDING SITE, designated SEQ ID:19362, to the nucleotide sequence of VGAM2038 RNA, herein designated VGAM RNA, also designated SEQ ID:4749.

[71414] A function of VGAM2038 is therefore inhibition of FLJ20298 (Accession NM_017752). Accordingly, utilities of VGAM2038 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20298. LOC201695 (Accession XM_120432) is another VGAM2038 host target gene. LOC201695 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201695, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201695 BINDING SITE, designated SEQ ID:43609, to the nucleotide sequence of VGAM2038 RNA, herein designated VGAM RNA, also designated SEQ ID:4749.

[71415] Another function of VGAM2038 is therefore inhibition of LOC201695 (Accession XM_120432). Accordingly, utilities of VGAM2038 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201695. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2039 (VGAM2039) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71416] VGAM2039 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2039 was detected is described hereinabove with reference to Figs. 1-8.

[71417] VGAM2039 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Marburg Virus. VGAM2039 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71418] VGAM2039 gene encodes a VGAM2039 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2039 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2039 precursor RNA is designated SEQ ID:2025, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2025 is located at position 2481 relative to the genome of Marburg Virus.

[71419] VGAM2039 precursor RNA folds onto itself, forming VGAM2039 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71420] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2039 folded precursor RNA into VGAM2039 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2039 RNA is designated SEQ ID:4750, and is provided hereinbelow with reference to the sequence listing part.

[71421] VGAM2039 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2039 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2039 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71422] VGAM2039 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2039 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2039 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2039 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2039 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71423] The complementary binding of VGAM2039 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2039 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2039 host target RNA into VGAM2039 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71424] It is appreciated that VGAM2039 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2039 host target genes. The mRNA of each one of this plurality of VGAM2039 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2039 RNA, herein designated VGAM RNA, and which when bound by VGAM2039 RNA causes inhibition of translation of respective one or more

VGAM2039 host target proteins.

[71425] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2039 gene, herein designated VGAM GENE, on one or more VGAM2039 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71426] It is yet further appreciated that a function of VGAM2039 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of viral infection by Marburg Virus. Specific

functions, and accordingly utilities, of VGAM2039 correlate with, and may be deduced from, the identity of the host target genes which VGAM2039 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71427] Nucleotide sequences of the VGAM2039 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2039 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2039 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2039 are further described hereinbelow with reference to Table 1.

[71428] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2039 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2039 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71429] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2039 gene, herein designated VGAM is inhibition of expression of VGAM2039 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2039 correlate with, and may be deduced from, the identity of the target genes which VGAM2039 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71430] ABH (Accession XM_007409) is a VGAM2039 host target gene. ABH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABH BINDING SITE, designated SEQ ID:30055, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71431] A function of VGAM2039 is therefore inhibition of ABH (Accession XM_007409). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABH. Attractin (ATRN, Accession NM_139321) is another VGAM2039 host target gene. ATRN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATRN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of ATRN BINDING SITE, designated SEQ ID:29299, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71432] Another function of VGAM2039 is therefore inhibition of Attractin (ATRN, Accession NM_139321), a gene which is involved in the initial immune cell clustering during inflammatory response. Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATRN. The function of ATRN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM53.Cardiotrophin 1 (CTF1, Accession NM_001330) is another VGAM2039 host target gene. CTF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CTF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTF1 BINDING SITE, designated SEQ ID:7011, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71433] Another function of VGAM2039 is therefore inhibition of Cardiotrophin 1 (CTF1, Accession NM_001330), a gene which may play a role in cardiac hypertrophy. Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTF1. The function of CTF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM71.Dystrobrevin, Alpha (DTNA, Accession NM_001390) is another VGAM2039 host target gene. DTNA BINDING SITE1 and DTNA BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DTNA, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DTNA BINDING SITE1 and DTNA BINDING SITE2, designated SEQ ID:7078 and SEQ ID:7081 respectively, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71434] Another function of VGAM2039 is therefore inhibition of Dystrobrevin, Alpha (DTNA, Accession NM_001390), a gene which may be involved in the formation and stability

of synapses. Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DTNA. The function of DTNA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1021.Glucosamine-6-phosphate Isomerase (GNPI, Accession NM_005471) is another VGAM2039 host target gene. GNPI BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GNPI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNPI BINDING SITE, designated SEQ ID:11966, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71435] Another function of VGAM2039 is therefore inhibition of Glucosamine-6-phosphate Isomerase (GNPI, Accession NM_005471), a gene which converts glucosamine-6-phosphate to fructose-6-phosphate. Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNPI. The function of GNPI and its association with

various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM124.Inducible T-cell Co-stimulator (ICOS, Accession NM_012092) is another VGAM2039 host target gene. ICOS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ICOS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICOS BINDING SITE, designated SEQ ID:14388, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71436] Another function of VGAM2039 is therefore inhibition of Inducible T-cell Co-stimulator (ICOS, Accession NM_012092), a gene which forms homodimers and functions as an inducible T-cell co-stimulator. Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICOS. The function of ICOS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM18.Insulin Receptor (INSR, Accession

XM_048346) is another VGAM2039 host target gene. INSR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by INSR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INSR BINDING SITE, designated SEQ ID:35155, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71437] Another function of VGAM2039 is therefore inhibition of Insulin Receptor (INSR, Accession XM_048346), a gene which binds insulin and has a tyrosine-protein kinase activity. Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INSR. The function of INSR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.Integrin, Alpha 4 (antigen CD49D, alpha 4 subunit of VLA-4 receptor) (ITGA4, Accession NM_000885) is another VGAM2039 host target gene. ITGA4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ITGA4, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA4 BINDING SITE, designated SEQ ID:6582, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71438] Another function of VGAM2039 is therefore inhibition of Integrin, Alpha 4 (antigen CD49D, alpha 4 subunit of VLA-4 receptor) (ITGA4, Accession NM_000885), a gene which recognizes one or more domains within the alternatively spliced cs-1 and cs-5 regions of fibronectin. Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA4. The function of ITGA4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1096.LNK (Accession NM_005475) is another VGAM2039 host target gene. LNK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LNK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LNK BINDING

SITE, designated SEQ ID:11973, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71439] Another function of VGAM2039 is therefore inhibition of LNK (Accession NM_005475), a gene which links T-cell receptor activation signal to phospholipase c-gamma-1, grb-2 and phosphatidylinositol 3-kinase (by similarity). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LNK. The function of LNK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM115.V-maf Musculoaponeurotic Fibrosarcoma Oncogene Homolog (avian) (MAF, Accession NM_005360) is another VGAM2039 host target gene. MAF BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAF BINDING SITE, designated SEQ ID:11835, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ

ID:4750.

[71440] Another function of VGAM2039 is therefore inhibition of V-maf Musculoaponeurotic Fibrosarcoma Oncogene Homolog (avian) (MAF, Accession NM_005360), a gene which is a transcription factor; contains a leucine zipper motif. Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAF. The function of MAF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM822.Mastermind-like 1 (Drosophila) (MAML1, Accession NM_014757) is another VGAM2039 host target gene. MAML1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAML1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAML1 BINDING SITE, designated SEQ ID:16498, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71441] Another function of VGAM2039 is therefore inhibition of Mastermind-like 1 (Drosophila) (MAML1, Accession

NM_014757), a gene which MAML1 functions as a transcriptional coactivator for Notch signaling. Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAML1. The function of MAML1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM556.Matrix Metalloproteinase 13 (collagenase 3) (MMP13, Accession NM_002427) is another VGAM2039 host target gene. MMP13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MMP13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP13 BINDING SITE, designated SEQ ID:8260, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71442] Another function of VGAM2039 is therefore inhibition of Matrix Metalloproteinase 13 (collagenase 3) (MMP13, Accession NM_002427). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP13. Neu-

rotrophic Tyrosine Kinase, Receptor, Type 2 (NTRK2, Accession NM_006180) is another VGAM2039 host target gene. NTRK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NTRK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTRK2 BINDING SITE, designated SEQ ID:12842, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71443] Another function of VGAM2039 is therefore inhibition of Neurotrophic Tyrosine Kinase, Receptor, Type 2 (NTRK2, Accession NM_006180), a gene which is involved in the development and/or maintenance of the nervous system. Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTRK2. The function of NTRK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM341.2'-5'-oligoadenylate Synthetase 3, 100kDa (OAS3, Accession NM_006187) is another VGAM2039 host

target gene. OAS3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OAS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OAS3 BINDING SITE, designated SEQ ID:12861, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71444] Another function of VGAM2039 is therefore inhibition of 2'-5'-oligoadenylate Synthetase 3, 100kDa (OAS3, Accession NM_006187), a gene which may play a role in mediating resistance to virus infection, control of cell growth, differentiation, and apoptosis. Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAS3. The function of OAS3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM309.Prostaglandin F2 Receptor Negative Regulator (PTGFRN, Accession XM_040709) is another VGAM2039 host target gene. PTGFRN BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by PTGFRN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGFRN BINDING SITE, designated SEQ ID:33364, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71445] Another function of VGAM2039 is therefore inhibition of Prostaglandin F2 Receptor Negative Regulator (PTGFRN, Accession XM_040709), a gene which inhibits the binding of prostaglandin f2-alpha (pgf2- alpha) to its specific fp receptor. Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGFRN. The function of PTGFRN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125.Regulator of G-protein Signalling 16 (RGS16, Accession NM_002928) is another VGAM2039 host target gene. RGS16 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RGS16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of RGS16 BINDING SITE, designated SEQ ID:8832, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71446] Another function of VGAM2039 is therefore inhibition of Regulator of G-protein Signalling 16 (RGS16, Accession NM_002928), a gene which inhibits signal transduction. Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS16. The function of RGS16 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1843.Regulator of G-protein Signalling 19 Interacting Protein 1 (RGS19IP1, Accession XM_031263) is another VGAM2039 host target gene. RGS19IP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RGS19IP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS19IP1 BINDING SITE, designated SEQ ID:31325, to the nucleotide

sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71447] Another function of VGAM2039 is therefore inhibition of Regulator of G-protein Signalling 19 Interacting Protein 1 (RGS19IP1, Accession XM_031263), a gene which is involved in g protein-linked signaling. Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS19IP1. The function of RGS19IP1 has been established by previous studies. Northern blot analysis detected a 1.8-kb C19ORF3 transcript in all tissues tested, with strongest expression in pancreas, followed by skeletal muscle, brain, kidney, placenta, lung, liver, and lowest expression in heart. Expression levels did not correlate with those of GAIP. Immunoblot analysis demonstrated the presence of C19ORF3 primarily in cytosolic fractions but also in membrane fractions. Immunofluorescence analysis showed expression of endogenous C19ORF3 in both a diffuse and a punctate staining pattern throughout the cytoplasm. Using a yeast 2-hybrid system, Bunn et al. (1999) isolated a cDNA encoding C19ORF3, which they called GLUT1CBP (GLUT1 (SLC2A1; 138140) C-terminus-binding protein). SDS-PAGE and Western blot anal-

yses determined that C19ORF3 is expressed as a 39-kD protein in all tissues tested except small intestine. Yeast 2-hybrid analysis showed that C19ORF3 binds SLC2A1 through its PDZ domain. Northern blot analysis revealed similar expression patterns for C19ORF3 and SLC2A1, with both being expressed most strongly in brain. Using a yeast 2-hybrid screen for brain-interacting proteins, the authors determined that only SLC2A1, KIF1B, and alpha actinin-1 (ACTN1; 102575) bind C19ORF3 through its PDZ domain; myosin VI (MYO6; 600970) was shown to interact with C19ORF3 but not via the PDZ domain.

[71448] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[71449] Bunn, R. C.; Jensen, M. A.; Reed, B. C. : Protein interactions with the glucose transporter binding protein GLUT1CBP that provide a link between GLUT1 and the cytoskeleton. Molec. Biol. Cell 10: 819-832, 1999. ; and

[71450] Von Kap-Herr, C.; Kandala, G.; Mann, S. S.; Hart, T. C.; Pettenati, M. J.; Setaluri, V. : Assignment of PDZ domain-containing protein GIPC gene (C19orf3) to human chromosome band 19p13.1 b.

[71451] Further studies establishing the function and utilities of

RGS19IP1 are found in John Hopkins OMIM database record ID 605072, and in sited publications numbered 6953-6955 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.SRY (sex determining region Y)-box 12 (SOX12, Accession NM_006943) is another VGAM2039 host target gene. SOX12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SOX12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX12 BINDING SITE, designated SEQ ID:13830, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71452] Another function of VGAM2039 is therefore inhibition of SRY (sex determining region Y)-box 12 (SOX12, Accession NM_006943). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX12. Transglutaminase 2 (C polypeptide, protein-glutamine-gamma-glutamyltransferase) (TGM2, Accession NM_004613) is another VGAM2039 host target gene.

TGM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TGM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGM2 BINDING SITE, designated SEQ ID:10954, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71453] Another function of VGAM2039 is therefore inhibition of Transglutaminase 2 (C polypeptide, protein-glutamine-gamma-glutamyltransferase) (TGM2, Accession NM_004613), a gene which catalyzes the cross-linking of proteins and the conjugation of polyamines to proteins. Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGM2. The function of TGM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM899.Tumor Protein P63 (TP63, Accession NM_003722) is another VGAM2039 host target gene. TP63 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TP63, corresponding to a HOST TARGET bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP63 BINDING SITE, designated SEQ ID:9815, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71454] Another function of VGAM2039 is therefore inhibition of Tumor Protein P63 (TP63, Accession NM_003722). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP63. Vitamin D (1,25- dihydroxyvitamin D3) Receptor (VDR, Accession NM_000376) is another VGAM2039 host target gene. VDR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VDR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VDR BINDING SITE, designated SEQ ID:5947, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71455] Another function of VGAM2039 is therefore inhibition of Vitamin D (1,25- dihydroxyvitamin D3) Receptor (VDR,

Accession NM_000376). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VDR. Williams-Beuren Syndrome Chromosome Region 1 (WBSCR1, Accession NM_022170) is another VGAM2039 host target gene. WBSCR1 BINDING SITE1 and WBSCR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WBSCR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WBSCR1 BINDING SITE1 and WBSCR1 BINDING SITE2, designated SEQ ID:22722 and SEQ ID:25705 respectively, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71456] Another function of VGAM2039 is therefore inhibition of Williams-Beuren Syndrome Chromosome Region 1 (WBSCR1, Accession NM_022170), a gene which stimulates protein translation. Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR1. The function of WBSCR1 and its association with various diseases and clinical conditions, has been estab-

lished by previous studies, as described hereinabove with reference to VGAM110.Basic, Immunoglobulin-like Variable Motif Containing (BIVM, Accession NM_017693) is another VGAM2039 host target gene. BIVM BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BIVM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIVM BINDING SITE, designated SEQ ID:19252, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71457] Another function of VGAM2039 is therefore inhibition of Basic, Immunoglobulin-like Variable Motif Containing (BIVM, Accession NM_017693). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIVM. Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM_004273) is another VGAM2039 host target gene. CHST3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHST3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of CHST3 BINDING SITE, designated SEQ ID:10480, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71458] Another function of VGAM2039 is therefore inhibition of Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM_004273). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST3. CPR2 (Accession NM_030900) is another VGAM2039 host target gene. CPR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CPR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPR2 BINDING SITE, designated SEQ ID:25175, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71459] Another function of VGAM2039 is therefore inhibition of CPR2 (Accession NM_030900). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with CPR2. DCOHM (Accession NM_032151) is another VGAM2039 host target gene. DCOHM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DCOHM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCOHM BINDING SITE, designated SEQ ID:25845, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71460] Another function of VGAM2039 is therefore inhibition of DCOHM (Accession NM_032151). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCOHM. FKSG44 (Accession NM_031904) is another VGAM2039 host target gene. FKSG44 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FKSG44, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKSG44 BINDING SITE, designated SEQ ID:25648, to the nucleotide

sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71461] Another function of VGAM2039 is therefore inhibition of FKSG44 (Accession NM_031904). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKSG44. FLJ10932 (Accession NM_018277) is another VGAM2039 host target gene. FLJ10932 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10932 BINDING SITE, designated SEQ ID:20263, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71462] Another function of VGAM2039 is therefore inhibition of FLJ10932 (Accession NM_018277). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10932. FLJ20729 (Accession NM_017953) is another VGAM2039 host target gene. FLJ20729 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by FLJ20729, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20729 BINDING SITE, designated SEQ ID:19656, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71463] Another function of VGAM2039 is therefore inhibition of FLJ20729 (Accession NM_017953). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20729. FLJ21916 (Accession NM_023112) is another VGAM2039 host target gene. FLJ21916 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21916, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21916 BINDING SITE, designated SEQ ID:23380, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71464] Another function of VGAM2039 is therefore inhibition of FLJ21916 (Accession NM_023112). Accordingly, utilities of

VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21916. FLJ22202 (Accession NM_024883) is another VGAM2039 host target gene. FLJ22202 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22202, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22202 BINDING SITE, designated SEQ ID:24337, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71465] Another function of VGAM2039 is therefore inhibition of FLJ22202 (Accession NM_024883). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22202. FLJ23462 (Accession NM_024843) is another VGAM2039 host target gene. FLJ23462 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23462

BINDING SITE, designated SEQ ID:24266, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71466] Another function of VGAM2039 is therefore inhibition of FLJ23462 (Accession NM_024843). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23462. Glutamate Receptor, Ionotropic, Delta 1 (GRID1, Accession XM_043613) is another VGAM2039 host target gene. GRID1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRID1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRID1 BINDING SITE, designated SEQ ID:33980, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71467] Another function of VGAM2039 is therefore inhibition of Glutamate Receptor, Ionotropic, Delta 1 (GRID1, Accession XM_043613). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRID1. Hyaluronan Binding

Protein 2 (HABP2, Accession NM_004132) is another VGAM2039 host target gene. HABP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HABP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HABP2 BINDING SITE, designated SEQ ID:10344, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71468] Another function of VGAM2039 is therefore inhibition of Hyaluronan Binding Protein 2 (HABP2, Accession NM_004132). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HABP2. HEMK (Accession NM_016173) is another VGAM2039 host target gene. HEMK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HEMK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEMK BINDING SITE, designated SEQ ID:18265, to the nucleotide sequence of VGAM2039 RNA, herein

designated VGAM RNA, also designated SEQ ID:4750.

[71469] Another function of VGAM2039 is therefore inhibition of HEMK (Accession NM_016173). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEMK. Interleukin 1 Receptor Accessory Protein-like 1 (IL1RAPL1, Accession NM_014271) is another VGAM2039 host target gene. IL1RAPL1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IL1RAPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1RAPL1 BINDING SITE, designated SEQ ID:15552, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71470] Another function of VGAM2039 is therefore inhibition of Interleukin 1 Receptor Accessory Protein-like 1 (IL1RAPL1, Accession NM_014271). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1RAPL1. KIAA0459 (Accession XM_027862) is another VGAM2039 host target gene. KIAA0459 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0459, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0459 BINDING SITE, designated SEQ ID:30575, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71471] Another function of VGAM2039 is therefore inhibition of KIAA0459 (Accession XM_027862). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0459. KIAA0731 (Accession XM_039975) is another VGAM2039 host target gene. KIAA0731 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0731, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0731 BINDING SITE, designated SEQ ID:33241, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71472] Another function of VGAM2039 is therefore inhibition of

KIAA0731 (Accession XM_039975). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0731. KIAA0960 (Accession XM_166543) is another VGAM2039 host target gene. KIAA0960 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0960 BINDING SITE, designated SEQ ID:44517, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71473] Another function of VGAM2039 is therefore inhibition of KIAA0960 (Accession XM_166543). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0960. KIAA1045 (Accession XM_048592) is another VGAM2039 host target gene. KIAA1045 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1045 BINDING SITE, designated SEQ ID:35196, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71474] Another function of VGAM2039 is therefore inhibition of KIAA1045 (Accession XM_048592). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1045. KIAA1184 (Accession NM_022572) is another VGAM2039 host target gene. KIAA1184 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1184, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1184 BINDING SITE, designated SEQ ID:22897, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71475] Another function of VGAM2039 is therefore inhibition of KIAA1184 (Accession NM_022572). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1184. KIAA1323 (Accession XM_032146) is another

VGAM2039 host target gene. KIAA1323 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1323 BINDING SITE, designated SEQ ID:31561, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71476] Another function of VGAM2039 is therefore inhibition of KIAA1323 (Accession XM_032146). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1323. KIAA1908 (Accession XM_055834) is another VGAM2039 host target gene. KIAA1908 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1908, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1908 BINDING SITE, designated SEQ ID:36334, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71477] Another function of VGAM2039 is therefore inhibition of KIAA1908 (Accession XM_055834). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1908. MACMARCKS (Accession NM_023009) is another VGAM2039 host target gene. MACMARCKS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MACMARCKS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MACMARCKS BINDING SITE, designated SEQ ID:23272, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71478] Another function of VGAM2039 is therefore inhibition of MACMARCKS (Accession NM_023009). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MACMARCKS. MOST2 (Accession NM_020250) is another VGAM2039 host target gene. MOST2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MOST2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOST2 BINDING SITE, designated SEQ ID:21551, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71479] Another function of VGAM2039 is therefore inhibition of MOST2 (Accession NM_020250). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOST2. MSTP028 (Accession NM_031954) is another VGAM2039 host target gene. MSTP028 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MSTP028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSTP028 BINDING SITE, designated SEQ ID:25694, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71480] Another function of VGAM2039 is therefore inhibition of MSTP028 (Accession NM_031954). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MSTP028. Nudix (nucleoside diphosphate linked moiety X)-type Motif 4 (NUDT4, Accession NM_019094) is another VGAM2039 host target gene. NUDT4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NUDT4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUDT4 BINDING SITE, designated SEQ ID:21169, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71481] Another function of VGAM2039 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety X)-type Motif 4 (NUDT4, Accession NM_019094). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDT4. TACTILE (Accession NM_005816) is another VGAM2039 host target gene. TACTILE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TACTILE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TACTILE

BINDING SITE, designated SEQ ID:12411, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71482] Another function of VGAM2039 is therefore inhibition of TACTILE (Accession NM_005816). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TACTILE. U5-116KD (Accession NM_004247) is another VGAM2039 host target gene. U5-116KD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by U5-116KD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of U5-116KD BINDING SITE, designated SEQ ID:10438, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71483] Another function of VGAM2039 is therefore inhibition of U5-116KD (Accession NM_004247). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with U5-116KD. UBE3B (Accession XM_084941) is another VGAM2039 host target gene. UBE3B BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by UBE3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE3B BINDING SITE, designated SEQ ID:37773, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71484] Another function of VGAM2039 is therefore inhibition of UBE3B (Accession XM_084941). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE3B. Ubiquitin Specific Protease 10 (USP10, Accession XM_033922) is another VGAM2039 host target gene. USP10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by USP10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP10 BINDING SITE, designated SEQ ID:31984, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71485] Another function of VGAM2039 is therefore inhibition of Ubiquitin Specific Protease 10 (USP10, Accession XM_033922). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP10. Zinc Finger, DHHC Domain Containing 2 (ZDHHC2, Accession NM_016353) is another VGAM2039 host target gene. ZDHHC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZDHHC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZDHHC2 BINDING SITE, designated SEQ ID:18488, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71486] Another function of VGAM2039 is therefore inhibition of Zinc Finger, DHHC Domain Containing 2 (ZDHHC2, Accession NM_016353). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC2. LOC138389 (Accession XM_072534) is another VGAM2039 host target gene. LOC138389 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded

by LOC138389, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138389 BINDING SITE, designated SEQ ID:37506, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71487] Another function of VGAM2039 is therefore inhibition of LOC138389 (Accession XM_072534). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138389. LOC144110 (Accession XM_084735) is another VGAM2039 host target gene. LOC144110 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144110 BINDING SITE, designated SEQ ID:37679, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71488] Another function of VGAM2039 is therefore inhibition of LOC144110 (Accession XM_084735). Accordingly, utilities

of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144110. LOC144558 (Accession XM_096629) is another VGAM2039 host target gene. LOC144558 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144558, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144558 BINDING SITE, designated SEQ ID:40438, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71489] Another function of VGAM2039 is therefore inhibition of LOC144558 (Accession XM_096629). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144558. LOC144893 (Accession XM_096687) is another VGAM2039 host target gene. LOC144893 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144893, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC144893 BINDING SITE, designated SEQ ID:40459, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71490] Another function of VGAM2039 is therefore inhibition of LOC144893 (Accession XM_096687). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144893. LOC145368 (Accession XM_085112) is another VGAM2039 host target gene. LOC145368 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145368, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145368 BINDING SITE, designated SEQ ID:37828, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71491] Another function of VGAM2039 is therefore inhibition of LOC145368 (Accession XM_085112). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145368. LOC145719 (Accession XM_096848) is another VGAM2039 host target gene. LOC145719 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145719 BINDING SITE, designated SEQ ID:40576, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71492] Another function of VGAM2039 is therefore inhibition of LOC145719 (Accession XM_096848). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145719. LOC145720 (Accession XM_096846) is another VGAM2039 host target gene. LOC145720 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145720, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145720 BINDING SITE, designated SEQ ID:40565, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71493] Another function of VGAM2039 is therefore inhibition of

LOC145720 (Accession XM_096846). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145720. LOC146346 (Accession XM_085430) is another VGAM2039 host target gene. LOC146346 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146346, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146346 BINDING SITE, designated SEQ ID:38135, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71494] Another function of VGAM2039 is therefore inhibition of LOC146346 (Accession XM_085430). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146346. LOC148029 (Accession XM_086014) is another VGAM2039 host target gene. LOC148029 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148029, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC148029 BINDING SITE, designated SEQ ID:38445, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71495] Another function of VGAM2039 is therefore inhibition of LOC148029 (Accession XM_086014). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148029. LOC150423 (Accession XM_086912) is another VGAM2039 host target gene. LOC150423 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150423 BINDING SITE, designated SEQ ID:38968, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71496] Another function of VGAM2039 is therefore inhibition of LOC150423 (Accession XM_086912). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150423. LOC155072 (Accession XM_098661) is an-

other VGAM2039 host target gene. LOC155072 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC155072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155072 BINDING SITE, designated SEQ ID:41760, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71497] Another function of VGAM2039 is therefore inhibition of LOC155072 (Accession XM_098661). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155072. LOC158156 (Accession XM_088496) is another VGAM2039 host target gene. LOC158156 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158156, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158156 BINDING SITE, designated SEQ ID:39741, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71498] Another function of VGAM2039 is therefore inhibition of LOC158156 (Accession XM_088496). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158156. LOC169270 (Accession XM_095607) is another VGAM2039 host target gene. LOC169270 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC169270, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169270 BINDING SITE, designated SEQ ID:40274, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71499] Another function of VGAM2039 is therefore inhibition of LOC169270 (Accession XM_095607). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169270. LOC197114 (Accession XM_116987) is another VGAM2039 host target gene. LOC197114 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC197114, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197114 BINDING SITE, designated SEQ ID:43188, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71500] Another function of VGAM2039 is therefore inhibition of LOC197114 (Accession XM_116987). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197114. LOC201799 (Accession XM_114380) is another VGAM2039 host target gene. LOC201799 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201799, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201799 BINDING SITE, designated SEQ ID:42916, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71501] Another function of VGAM2039 is therefore inhibition of LOC201799 (Accession XM_114380). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC201799. LOC202868 (Accession XM_117477) is another VGAM2039 host target gene. LOC202868 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC202868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202868 BINDING SITE, designated SEQ ID:43447, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71502] Another function of VGAM2039 is therefore inhibition of LOC202868 (Accession XM_117477). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202868. LOC220758 (Accession XM_165466) is another VGAM2039 host target gene. LOC220758 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220758, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220758 BINDING SITE, designated SEQ ID:43642, to the nucleotide sequence of VGAM2039 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4750.

[71503] Another function of VGAM2039 is therefore inhibition of LOC220758 (Accession XM_165466). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220758. LOC221528 (Accession XM_166377) is another VGAM2039 host target gene. LOC221528 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221528, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221528 BINDING SITE, designated SEQ ID:44211, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71504] Another function of VGAM2039 is therefore inhibition of LOC221528 (Accession XM_166377). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221528. LOC221687 (Accession XM_166423) is another VGAM2039 host target gene. LOC221687 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221687, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221687 BINDING SITE, designated SEQ ID:44307, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71505] Another function of VGAM2039 is therefore inhibition of LOC221687 (Accession XM_166423). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221687. LOC221882 (Accession XM_166507) is another VGAM2039 host target gene. LOC221882 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221882, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221882 BINDING SITE, designated SEQ ID:44433, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71506] Another function of VGAM2039 is therefore inhibition of LOC221882 (Accession XM_166507). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC221882. LOC255461 (Accession XM_173207) is another VGAM2039 host target gene. LOC255461 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255461, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255461 BINDING SITE, designated SEQ ID:46465, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71507] Another function of VGAM2039 is therefore inhibition of LOC255461 (Accession XM_173207). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255461. LOC255516 (Accession XM_173212) is another VGAM2039 host target gene. LOC255516 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255516, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255516 BINDING SITE, designated SEQ ID:46471, to

the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71508] Another function of VGAM2039 is therefore inhibition of LOC255516 (Accession XM_173212). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255516. LOC256789 (Accession XM_173369) is another VGAM2039 host target gene. LOC256789 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256789 BINDING SITE, designated SEQ ID:46536, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71509] Another function of VGAM2039 is therefore inhibition of LOC256789 (Accession XM_173369). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256789. LOC257552 (Accession XM_175174) is another VGAM2039 host target gene. LOC257552 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC257552, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257552 BINDING SITE, designated SEQ ID:46670, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71510] Another function of VGAM2039 is therefore inhibition of LOC257552 (Accession XM_175174). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257552. LOC257602 (Accession XM_175246) is another VGAM2039 host target gene. LOC257602 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257602, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257602 BINDING SITE, designated SEQ ID:46700, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71511] Another function of VGAM2039 is therefore inhibition of LOC257602 (Accession XM_175246). Accordingly, utilities

of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257602. LOC90342 (Accession XM_031009) is another VGAM2039 host target gene. LOC90342 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90342 BINDING SITE, designated SEQ ID:31251, to the nucleotide sequence of VGAM2039 RNA, herein designated VGAM RNA, also designated SEQ ID:4750.

[71512] Another function of VGAM2039 is therefore inhibition of LOC90342 (Accession XM_031009). Accordingly, utilities of VGAM2039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90342. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2040 (VGAM2040) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71513] VGAM2040 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2040 was detected is described hereinabove with reference to Figs. 1-8.

[71514] VGAM2040 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Marburg Virus. VGAM2040 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71515] VGAM2040 gene encodes a VGAM2040 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2040 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2040 precursor RNA is designated SEQ ID:2026, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2026 is located at position 5679 relative to the genome of Marburg Virus.

[71516] VGAM2040 precursor RNA folds onto itself, forming VGAM2040 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71517] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2040 folded precursor RNA into VGAM2040 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2040 RNA is designated SEQ ID:4751, and is provided hereinbelow with reference to the sequence listing part.

[71518] VGAM2040 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2040 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2040 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[71519] VGAM2040 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2040 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2040 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2040 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2040 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71520] The complementary binding of VGAM2040 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2040 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2040 host target RNA into VGAM2040 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71521] It is appreciated that VGAM2040 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2040 host target genes. The mRNA of each one of this plurality of VGAM2040 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2040 RNA, herein designated VGAM RNA, and which when bound by VGAM2040 RNA causes inhibition of translation of respective one or more VGAM2040 host target proteins.

[71522] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2040 gene, herein designated VGAM GENE, on one or more VGAM2040 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71523] It is yet further appreciated that a function of VGAM2040 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2040 include diagnosis, prevention and treatment of viral infection by Marburg Virus. Specific functions, and accordingly utilities, of VGAM2040 correlate with, and may be deduced from, the identity of the host target genes which VGAM2040 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71524] Nucleotide sequences of the VGAM2040 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2040 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2040 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2040 are further described hereinbelow with reference to Table 1.

[71525] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2040 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2040 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71526] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2040 gene, herein designated VGAM is inhibition of expression of VGAM2040 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2040 correlate with, and may be deduced from, the identity of the target genes which VGAM2040 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71527] A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 1 (ADAMTS1, Acces-

sion NM_006988) is a VGAM2040 host target gene. ADAMTS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADAMTS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS1 BINDING SITE, designated SEQ ID:13852, to the nucleotide sequence of VGAM2040 RNA, herein designated VGAM RNA, also designated SEQ ID:4751.

[71528] A function of VGAM2040 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 1 (ADAMTS1, Accession NM_006988). Accordingly, utilities of VGAM2040 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS1. EGF-containing Fibulin-like Extracellular Matrix Protein 1 (EFEMP1, Accession NM_004105) is another VGAM2040 host target gene. EFEMP1 BINDING SITE1 and EFEMP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by EFEMP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the comple-

mentarity of the nucleotide sequences of EFEMP1 BINDING SITE1 and EFEMP1 BINDING SITE2, designated SEQ ID:10319 and SEQ ID:20839 respectively, to the nucleotide sequence of VGAM2040 RNA, herein designated VGAM RNA, also designated SEQ ID:4751.

[71529] Another function of VGAM2040 is therefore inhibition of EGF-containing Fibulin-like Extracellular Matrix Protein 1 (EFEMP1, Accession NM_004105). Accordingly, utilities of VGAM2040 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFEMP1. Phosphoribosyl Pyrophosphate Amidotransferase (PPAT, Accession NM_002703) is another VGAM2040 host target gene. PPAT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPAT BINDING SITE, designated SEQ ID:8552, to the nucleotide sequence of VGAM2040 RNA, herein designated VGAM RNA, also designated SEQ ID:4751.

[71530] Another function of VGAM2040 is therefore inhibition of Phosphoribosyl Pyrophosphate Amidotransferase (PPAT, Accession NM_002703). Accordingly, utilities of

VGAM2040 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPAT. Secretogranin III (SCG3, Accession NM_013243) is another VGAM2040 host target gene. SCG3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCG3 BINDING SITE, designated SEQ ID:14905, to the nucleotide sequence of VGAM2040 RNA, herein designated VGAM RNA, also designated SEQ ID:4751.

[71531] Another function of VGAM2040 is therefore inhibition of Secretogranin III (SCG3, Accession NM_013243). Accordingly, utilities of VGAM2040 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCG3. SH3-domain Binding Protein 2 (SH3BP2, Accession NM_003023) is another VGAM2040 host target gene. SH3BP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SH3BP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of SH3BP2 BINDING SITE, designated SEQ ID:8950, to the nucleotide sequence of VGAM2040 RNA, herein designated VGAM RNA, also designated SEQ ID:4751.

[71532] Another function of VGAM2040 is therefore inhibition of SH3-domain Binding Protein 2 (SH3BP2, Accession NM_003023). Accordingly, utilities of VGAM2040 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BP2. KIAA1795 (Accession XM_050988) is another VGAM2040 host target gene. KIAA1795 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1795 BINDING SITE, designated SEQ ID:35703, to the nucleotide sequence of VGAM2040 RNA, herein designated VGAM RNA, also designated SEQ ID:4751.

[71533] Another function of VGAM2040 is therefore inhibition of KIAA1795 (Accession XM_050988). Accordingly, utilities of VGAM2040 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1795. UBE3B (Accession XM_084941) is another VGAM2040 host target gene. UBE3B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UBE3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE3B BINDING SITE, designated SEQ ID:37776, to the nucleotide sequence of VGAM2040 RNA, herein designated VGAM RNA, also designated SEQ ID:4751.

[71534] Another function of VGAM2040 is therefore inhibition of UBE3B (Accession XM_084941). Accordingly, utilities of VGAM2040 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE3B. LOC129446 (Accession XM_072203) is another VGAM2040 host target gene. LOC129446 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC129446, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129446 BINDING SITE, designated SEQ ID:37467, to the nucleotide sequence of VGAM2040 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4751.

[71535] Another function of VGAM2040 is therefore inhibition of LOC129446 (Accession XM_072203). Accordingly, utilities of VGAM2040 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129446. LOC158549 (Accession XM_098963) is another VGAM2040 host target gene. LOC158549 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158549 BINDING SITE, designated SEQ ID:42010, to the nucleotide sequence of VGAM2040 RNA, herein designated VGAM RNA, also designated SEQ ID:4751.

[71536] Another function of VGAM2040 is therefore inhibition of LOC158549 (Accession XM_098963). Accordingly, utilities of VGAM2040 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158549. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2041 (VGAM2041) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71537] VGAM2041 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2041 was detected is described hereinabove with reference to Figs. 1-8.

[71538] VGAM2041 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Marburg Virus. VGAM2041 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71539] VGAM2041 gene encodes a VGAM2041 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2041 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2041 precursor RNA is designated SEQ ID:2027, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2027 is located at position 9817 relative to the genome of Marburg Virus.

[71540] VGAM2041 precursor RNA folds onto itself, forming

VGAM2041 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71541] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2041 folded precursor RNA into VGAM2041 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2041 RNA is designated SEQ ID:4752, and is provided hereinbelow with reference to the sequence listing part.

[71542] VGAM2041 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2041 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2041 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71543] VGAM2041 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2041 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2041 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2041 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2041 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71544] The complementary binding of VGAM2041 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2041 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2041 host target RNA into VGAM2041 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71545] It is appreciated that VGAM2041 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2041 host target genes. The mRNA of each one of this plurality of VGAM2041 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2041 RNA, herein designated VGAM RNA, and which when bound by VGAM2041 RNA causes inhibition of translation of respective one or more VGAM2041 host target proteins.

[71546] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2041 gene, herein designated VGAM GENE, on one or more VGAM2041 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71547] It is yet further appreciated that a function of VGAM2041 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2041 include diagnosis, prevention and treatment of viral infection by Marburg Virus. Specific functions, and accordingly utilities, of VGAM2041 correlate with, and may be deduced from, the identity of the host target genes which VGAM2041 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[71548] Nucleotide sequences of the VGAM2041 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2041 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2041 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2041 are further described hereinbelow with reference to Table 1.

[71549] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2041 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2041 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71550] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2041 gene, herein designated VGAM is inhibition of expression of VGAM2041 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2041 correlate with, and may be deduced from, the identity of the target genes which VGAM2041 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[71551] Cytoplasmic Linker Associated Protein 1 (CLASP1, Accession XM_037105) is a VGAM2041 host target gene. CLASP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLASP1 BINDING SITE, designated SEQ ID:32541, to the nucleotide sequence of VGAM2041 RNA, herein designated VGAM RNA, also designated SEQ ID:4752.

[71552] A function of VGAM2041 is therefore inhibition of Cytoplasmic Linker Associated Protein 1 (CLASP1, Accession XM_037105), a gene which plays a role in the local regulation of microtubule dynamics . Accordingly, utilities of VGAM2041 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLASP1. The function of CLASP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM298.Histamine Receptor H1 (HRH1, Accession NM_000861) is another VGAM2041 host target

gene. HRH1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HRH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRH1 BINDING SITE, designated SEQ ID:6523, to the nucleotide sequence of VGAM2041 RNA, herein designated VGAM RNA, also designated SEQ ID:4752.

[71553] Another function of VGAM2041 is therefore inhibition of Histamine Receptor H1 (HRH1, Accession NM_000861), a gene which stimulates the synthesis of inositol phosphate. Accordingly, utilities of VGAM2041 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRH1. The function of HRH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM766.Protein Kinase, AMP-activated, Beta 1 Non-catalytic Subunit (PRKAB1, Accession NM_006253) is another VGAM2041 host target gene. PRKAB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRKAB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of PRKAB1 BINDING SITE, designated SEQ ID:12933, to the nucleotide sequence of VGAM2041 RNA, herein designated VGAM RNA, also designated SEQ ID:4752.

[71554] Another function of VGAM2041 is therefore inhibition of Protein Kinase, AMP-activated, Beta 1 Non-catalytic Subunit (PRKAB1, Accession NM_006253), a gene which is responsible for the regulation of fatty acid synthesis by phosphorylation of acetyl-coa carboxylase. Accordingly, utilities of VGAM2041 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKAB1. The function of PRKAB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1384.TERA (Accession NM_021238) is another VGAM2041 host target gene. TERA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TERA BINDING SITE, designated SEQ ID:22204,

to the nucleotide sequence of VGAM2041 RNA, herein designated VGAM RNA, also designated SEQ ID:4752.

[71555] Another function of VGAM2041 is therefore inhibition of TERA (Accession NM_021238). Accordingly, utilities of VGAM2041 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TERA. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2042 (VGAM2042) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71556] VGAM2042 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2042 was detected is described hereinabove with reference to Figs. 1-8.

[71557] VGAM2042 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM2042 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71558] VGAM2042 gene encodes a VGAM2042 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2042 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2042 precursor RNA is designated SEQ ID:2028, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2028 is located at position 207065 relative to the genome of Human Herpesvirus 5.

[71559] VGAM2042 precursor RNA folds onto itself, forming VGAM2042 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71560] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2042 folded precursor RNA into VGAM2042 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM2042 RNA is designated SEQ ID:4753, and is provided hereinbelow with reference to the sequence listing part.

[71561] VGAM2042 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2042 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2042 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71562] VGAM2042 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2042 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2042 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2042 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2042 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71563] The complementary binding of VGAM2042 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2042 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2042 host target RNA into VGAM2042 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71564] It is appreciated that VGAM2042 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2042 host target genes. The mRNA of

each one of this plurality of VGAM2042 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2042 RNA, herein designated VGAM RNA, and which when bound by VGAM2042 RNA causes inhibition of translation of respective one or more VGAM2042 host target proteins.

[71565] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2042 gene, herein designated VGAM GENE, on one or more VGAM2042 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[71566] It is yet further appreciated that a function of VGAM2042 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2042 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2042 correlate with, and may be deduced from, the identity of the host target genes which VGAM2042 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71567] Nucleotide sequences of the VGAM2042 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2042 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2042 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2042 are further described hereinbelow with reference to Table 1.

[71568] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2042 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2042 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71569] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2042 gene, herein designated VGAM is inhibition of expression of VGAM2042 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2042 correlate with, and may be deduced from, the identity of the target genes which VGAM2042 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71570] Filamin B, Beta (actin binding protein 278) (FLNB, Accession XM_030806) is a VGAM2042 host target gene. FLNB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLNB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLNB BINDING SITE, designated SEQ ID:31148, to the nucleotide sequence of VGAM2042 RNA, herein designated VGAM RNA, also designated SEQ ID:4753.

[71571] A function of VGAM2042 is therefore inhibition of Filamin B, Beta (actin binding protein 278) (FLNB, Accession XM_030806), a gene which Filamin B, beta; binds actin,

interacts with cytoplasmic domain of Ibalpha. Accordingly, utilities of VGAM2042 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLNB. The function of FLNB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM416.Junctophilin 3 (JPH3, Accession NM_020655) is another VGAM2042 host target gene. JPH3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by JPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JPH3 BINDING SITE, designated SEQ ID:21826, to the nucleotide sequence of VGAM2042 RNA, herein designated VGAM RNA, also designated SEQ ID:4753.

[71572] Another function of VGAM2042 is therefore inhibition of Junctophilin 3 (JPH3, Accession NM_020655), a gene which is involved in cytoskeletal organization and cellular growth. Accordingly, utilities of VGAM2042 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JPH3. The function of JPH3 and its association with various diseases and clinical condi-

tions, has been established by previous studies, as described hereinabove with reference to VGAM254.FLJ23598 (Accession NM_024783) is another VGAM2042 host target gene. FLJ23598 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ23598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23598 BINDING SITE, designated SEQ ID:24157, to the nucleotide sequence of VGAM2042 RNA, herein designated VGAM RNA, also designated SEQ ID:4753.

[71573] Another function of VGAM2042 is therefore inhibition of FLJ23598 (Accession NM_024783). Accordingly, utilities of VGAM2042 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23598. KIAA0295 (Accession XM_042833) is another VGAM2042 host target gene. KIAA0295 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0295 BINDING SITE, designated SEQ ID:33785, to the nucleotide sequence of VGAM2042 RNA, herein designated VGAM RNA, also designated SEQ ID:4753.

[71574] Another function of VGAM2042 is therefore inhibition of KIAA0295 (Accession XM_042833). Accordingly, utilities of VGAM2042 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0295. LOC149372 (Accession XM_086509) is another VGAM2042 host target gene. LOC149372 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149372, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149372 BINDING SITE, designated SEQ ID:38725, to the nucleotide sequence of VGAM2042 RNA, herein designated VGAM RNA, also designated SEQ ID:4753.

[71575] Another function of VGAM2042 is therefore inhibition of LOC149372 (Accession XM_086509). Accordingly, utilities of VGAM2042 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149372. LOC150577 (Accession XM_097918) is another VGAM2042 host target gene. LOC150577 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150577 BINDING SITE, designated SEQ ID:41217, to the nucleotide sequence of VGAM2042 RNA, herein designated VGAM RNA, also designated SEQ ID:4753.

[71576] Another function of VGAM2042 is therefore inhibition of LOC150577 (Accession XM_097918). Accordingly, utilities of VGAM2042 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150577. LOC157627 (Accession XM_088347) is another VGAM2042 host target gene. LOC157627 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157627 BINDING SITE, designated SEQ ID:39619, to the nucleotide sequence of VGAM2042 RNA, herein designated VGAM RNA, also designated SEQ ID:4753.

[71577] Another function of VGAM2042 is therefore inhibition of

LOC157627 (Accession XM_088347). Accordingly, utilities of VGAM2042 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157627. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2043 (VGAM2043) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71578] VGAM2043 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2043 was detected is described hereinabove with reference to Figs. 1-8.

[71579] VGAM2043 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM2043 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71580] VGAM2043 gene encodes a VGAM2043 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2043 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2043 precursor RNA is designated SEQ ID:2029, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2029 is located at position 200386 relative to the genome of Human Herpesvirus 5.

[71581] VGAM2043 precursor RNA folds onto itself, forming VGAM2043 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71582] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2043 folded precursor RNA into VGAM2043 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide se-

quence of VGAM2043 RNA is designated SEQ ID:4754, and is provided hereinbelow with reference to the sequence listing part.

[71583] VGAM2043 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2043 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2043 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71584] VGAM2043 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2043 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2043 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2043 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2043 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71585] The complementary binding of VGAM2043 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2043 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2043 host target RNA into VGAM2043 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71586] It is appreciated that VGAM2043 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2043 host target genes. The mRNA of each one of this plurality of VGAM2043 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2043 RNA, herein designated VGAM RNA, and which when bound by VGAM2043 RNA causes inhibition of translation of respective one or more VGAM2043 host target proteins.

[71587] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2043 gene, herein designated VGAM GENE, on one or more VGAM2043 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71588] It is yet further appreciated that a function of VGAM2043

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2043 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2043 correlate with, and may be deduced from, the identity of the host target genes which VGAM2043 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71589] Nucleotide sequences of the VGAM2043 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2043 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2043 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2043 are further described hereinbelow with reference to Table 1.

[71590] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2043 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2043 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71591] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2043 gene, herein designated VGAM is inhibition of expression of VGAM2043 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2043 correlate with, and may be deduced from, the identity of the target genes which VGAM2043 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71592] Actinin, Alpha 2 (ACTN2, Accession NM_001103) is a VGAM2043 host target gene. ACTN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ACTN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACTN2 BINDING SITE, designated SEQ ID:6760, to the nucleotide sequence of VGAM2043 RNA, herein designated VGAM RNA, also designated SEQ ID:4754.

[71593] A function of VGAM2043 is therefore inhibition of Actinin, Alpha 2 (ACTN2, Accession NM_001103), a gene which an actin-binding protein with multiple roles in different cell types. Accordingly, utilities of VGAM2043 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with ACTN2. The function of ACTN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM88.Protein Tyrosine Phosphatase, Receptor Type, G (PTPRG, Accession NM_002841) is another VGAM2043 host target gene. PTPRG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTPRG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRG BINDING SITE, designated SEQ ID:8728, to the nucleotide sequence of VGAM2043 RNA, herein designated VGAM RNA, also designated SEQ ID:4754.

[71594] Another function of VGAM2043 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, G (PTPRG, Accession NM_002841), a gene which is a candidate tumor suppressor and represents a subfamily of receptor tyrosine phosphatases. Accordingly, utilities of VGAM2043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRG. The function of PTPRG and its association with various diseases and clinical conditions, has been established by previous

studies, as described hereinabove with reference to VGAM1924.MIC2 Like 1 (MIC2L1, Accession NM_031462) is another VGAM2043 host target gene. MIC2L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MIC2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIC2L1 BINDING SITE, designated SEQ ID:25489, to the nucleotide sequence of VGAM2043 RNA, herein designated VGAM RNA, also designated SEQ ID:4754.

[71595] Another function of VGAM2043 is therefore inhibition of MIC2 Like 1 (MIC2L1, Accession NM_031462). Accordingly, utilities of VGAM2043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIC2L1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2044 (VGAM2044) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71596] VGAM2044 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2044 was detected is described hereinabove with reference to Figs. 1-8.

[71597] VGAM2044 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM2044 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71598] VGAM2044 gene encodes a VGAM2044 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2044 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2044 precursor RNA is designated SEQ ID:2030, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2030 is located at position 212421 relative to the genome of Human Herpesvirus 5.

[71599] VGAM2044 precursor RNA folds onto itself, forming VGAM2044 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71600] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2044 folded precursor RNA into VGAM2044 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM2044 RNA is designated SEQ ID:4755, and is provided hereinbelow with reference to the sequence listing part.

[71601] VGAM2044 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2044 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2044 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71602] VGAM2044 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2044 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2044 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2044 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2044 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71603] The complementary binding of VGAM2044 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2044 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2044 host target RNA into VGAM2044 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71604] It is appreciated that VGAM2044 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2044 host target genes. The mRNA of each one of this plurality of VGAM2044 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2044 RNA, herein designated VGAM RNA, and which when bound by VGAM2044 RNA causes inhibition of translation of respective one or more VGAM2044 host target proteins.

[71605] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2044 gene, herein designated VGAM GENE, on one or more VGAM2044 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71606] It is yet further appreciated that a function of VGAM2044 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2044 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2044 correlate with, and may be deduced from, the identity of the host target genes which VGAM2044 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71607] Nucleotide sequences of the VGAM2044 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2044 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2044 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2044 are further described hereinbelow with reference to Table 1.

[71608] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2044 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2044 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71609] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2044 gene, herein designated VGAM is inhibition of expression of VGAM2044 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2044 correlate with, and may be deduced from, the identity of the target genes which VGAM2044 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71610] Chromosome 8 Open Reading Frame 1 (C8orf1, Accession NM_004337) is a VGAM2044 host target gene. C8orf1 BINDING SITE is HOST TARGET binding site found in the

5` untranslated region of mRNA encoded by C8orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf1 BINDING SITE, designated SEQ ID:10531, to the nucleotide sequence of VGAM2044 RNA, herein designated VGAM RNA, also designated SEQ ID:4755.

[71611] A function of VGAM2044 is therefore inhibition of Chromosome 8 Open Reading Frame 1 (C8orf1, Accession NM_004337). Accordingly, utilities of VGAM2044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf1. Cullin 3 (CUL3, Accession NM_003590) is another VGAM2044 host target gene. CUL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CUL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CUL3 BINDING SITE, designated SEQ ID:9644, to the nucleotide sequence of VGAM2044 RNA, herein designated VGAM RNA, also designated SEQ ID:4755.

[71612] Another function of VGAM2044 is therefore inhibition of Cullin 3 (CUL3, Accession NM_003590), a gene which may

target other proteins for ubiquitin-dependent proteolysis. Accordingly, utilities of VGAM2044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CUL3. The function of CUL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM143.5-hydroxytryptamine (serotonin) Receptor 4 (HTR4, Accession NM_000870) is another VGAM2044 host target gene. HTR4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HTR4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTR4 BINDING SITE, designated SEQ ID:6542, to the nucleotide sequence of VGAM2044 RNA, herein designated VGAM RNA, also designated SEQ ID:4755.

[71613] Another function of VGAM2044 is therefore inhibition of 5-hydroxytryptamine (serotonin) Receptor 4 (HTR4, Accession NM_000870), a gene which mediates calcium channel currents. Accordingly, utilities of VGAM2044 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with HTR4. The function of HTR4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM65.RAB Interacting Factor (RABIF, Accession NM_002871) is another VGAM2044 host target gene. RABIF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RABIF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RABIF BINDING SITE, designated SEQ ID:8781, to the nucleotide sequence of VGAM2044 RNA, herein designated VGAM RNA, also designated SEQ ID:4755.

[71614] Another function of VGAM2044 is therefore inhibition of RAB Interacting Factor (RABIF, Accession NM_002871), a gene which is involved in the regulation of intracellular vesicular transport. Accordingly, utilities of VGAM2044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RABIF. The function of RABIF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM1633.Transient Receptor Potential Cation Channel, Subfamily C, Member 6 (TRPC6, Accession NM_004621) is another VGAM2044 host target gene. TRPC6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TRPC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPC6 BINDING SITE, designated SEQ ID:10976, to the nucleotide sequence of VGAM2044 RNA, herein designated VGAM RNA, also designated SEQ ID:4755.

[71615] Another function of VGAM2044 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily C, Member 6 (TRPC6, Accession NM_004621), a gene which has calcium channel activity. Accordingly, utilities of VGAM2044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPC6. The function of TRPC6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25.Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_014919) is another VGAM2044 host target gene. WHSC1 BINDING SITE1 through WHSC1

BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WHSC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE1 through WHSC1 BINDING SITE4, designated SEQ ID:17183, SEQ ID:28447, SEQ ID:28464 and SEQ ID:28475 respectively, to the nucleotide sequence of VGAM2044 RNA, herein designated VGAM RNA, also designated SEQ ID:4755.

[71616] Another function of VGAM2044 is therefore inhibition of Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_014919), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM2044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.DKFZp434J1015 (Accession XM_166538) is another VGAM2044 host target gene. DKFZp434J1015 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DK-

FZp434J1015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434J1015 BINDING SITE, designated SEQ ID:44506, to the nucleotide sequence of VGAM2044 RNA, herein designated VGAM RNA, also designated SEQ ID:4755.

[71617] Another function of VGAM2044 is therefore inhibition of DKFZp434J1015 (Accession XM_166538). Accordingly, utilities of VGAM2044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434J1015. IMAGE:4907098 (Accession XM_166247) is another VGAM2044 host target gene. IMAGE:4907098 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IMAGE:4907098, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMAGE:4907098 BINDING SITE, designated SEQ ID:44060, to the nucleotide sequence of VGAM2044 RNA, herein designated VGAM RNA, also designated SEQ ID:4755.

[71618] Another function of VGAM2044 is therefore inhibition of

IMAGE:4907098 (Accession XM_166247). Accordingly, utilities of VGAM2044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMAGE:4907098. LOC123876 (Accession XM_058743) is another VGAM2044 host target gene. LOC123876 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC123876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123876 BINDING SITE, designated SEQ ID:36733, to the nucleotide sequence of VGAM2044 RNA, herein designated VGAM RNA, also designated SEQ ID:4755.

[71619] Another function of VGAM2044 is therefore inhibition of LOC123876 (Accession XM_058743). Accordingly, utilities of VGAM2044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123876. LOC146316 (Accession XM_027568) is another VGAM2044 host target gene. LOC146316 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146316, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146316 BINDING SITE, designated SEQ ID:30526, to the nucleotide sequence of VGAM2044 RNA, herein designated VGAM RNA, also designated SEQ ID:4755.

[71620] Another function of VGAM2044 is therefore inhibition of LOC146316 (Accession XM_027568). Accordingly, utilities of VGAM2044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146316. LOC200470 (Accession XM_117235) is another VGAM2044 host target gene. LOC200470 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC200470, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200470 BINDING SITE, designated SEQ ID:43309, to the nucleotide sequence of VGAM2044 RNA, herein designated VGAM RNA, also designated SEQ ID:4755.

[71621] Another function of VGAM2044 is therefore inhibition of LOC200470 (Accession XM_117235). Accordingly, utilities of VGAM2044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC200470. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2045 (VGAM2045) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71622] VGAM2045 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2045 was detected is described hereinabove with reference to Figs. 1-8.

[71623] VGAM2045 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM2045 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71624] VGAM2045 gene encodes a VGAM2045 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2045 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2045 precursor RNA is designated SEQ ID:2031, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2031 is located at position 196544 relative to the genome of Human Herpesvirus 5.

[71625] VGAM2045 precursor RNA folds onto itself, forming VGAM2045 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71626] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2045 folded precursor RNA into VGAM2045 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2045 RNA is designated SEQ ID:4756, and is provided hereinbelow with reference to the sequence listing part.

[71627] VGAM2045 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2045 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2045 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71628] VGAM2045 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2045 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2045 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2045 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2045 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71629] The complementary binding of VGAM2045 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2045 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2045 host target RNA into VGAM2045 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71630] It is appreciated that VGAM2045 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2045 host target genes. The mRNA of each one of this plurality of VGAM2045 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2045 RNA, herein designated VGAM RNA, and which when bound by VGAM2045 RNA causes

inhibition of translation of respective one or more VGAM2045 host target proteins.

[71631] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2045 gene, herein designated VGAM GENE, on one or more VGAM2045 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71632] It is yet further appreciated that a function of VGAM2045 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2045 include diagnosis, prevention and

treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2045 correlate with, and may be deduced from, the identity of the host target genes which VGAM2045 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71633] Nucleotide sequences of the VGAM2045 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2045 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2045 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2045 are further described hereinbelow with reference to Table 1.

[71634] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2045 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2045 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71635] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2045 gene, herein designated VGAM is inhibition of expression of VGAM2045 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2045 correlate with, and may be deduced from, the identity of the target genes which VGAM2045 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71636] Interleukin 1 Receptor, Type I (IL1R1, Accession NM_000877) is a VGAM2045 host target gene. IL1R1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL1R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1R1 BINDING SITE, designated SEQ ID:6564, to the nucleotide sequence of VGAM2045 RNA, herein designated VGAM RNA, also designated SEQ ID:4756.

[71637] A function of VGAM2045 is therefore inhibition of Interleukin 1 Receptor, Type I (IL1R1, Accession NM_000877), a gene which is a receptor for interleukin-1 alpha (il-1a), beta (il-1b), and interleukin-1 receptor antagonist protein (il-1ra). Accordingly, utilities of VGAM2045 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1R1. The function of IL1R1 and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to VGAM704.Tryptophan Rich Basic Protein (WRB, Accession NM_004627) is another VGAM2045 host target gene. WRB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WRB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WRB BINDING SITE, designated SEQ ID:10997, to the nucleotide sequence of VGAM2045 RNA, herein designated VGAM RNA, also designated SEQ ID:4756.

[71638] Another function of VGAM2045 is therefore inhibition of Tryptophan Rich Basic Protein (WRB, Accession NM_004627). Accordingly, utilities of VGAM2045 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WRB. C6orf5 (Accession NM_015524) is another VGAM2045 host target gene. C6orf5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C6orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of C6orf5 BINDING SITE, designated SEQ ID:17777, to the nucleotide sequence of VGAM2045 RNA, herein designated VGAM RNA, also designated SEQ ID:4756.

[71639] Another function of VGAM2045 is therefore inhibition of C6orf5 (Accession NM_015524). Accordingly, utilities of VGAM2045 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf5. LOC203595 (Accession XM_119962) is another VGAM2045 host target gene. LOC203595 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203595, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203595 BINDING SITE, designated SEQ ID:43606, to the nucleotide sequence of VGAM2045 RNA, herein designated VGAM RNA, also designated SEQ ID:4756.

[71640] Another function of VGAM2045 is therefore inhibition of LOC203595 (Accession XM_119962). Accordingly, utilities of VGAM2045 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203595. LOC51667 (Accession NM_016118) is an-

other VGAM2045 host target gene. LOC51667 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51667, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51667 BINDING SITE, designated SEQ ID:18196, to the nucleotide sequence of VGAM2045 RNA, herein designated VGAM RNA, also designated SEQ ID:4756.

[71641] Another function of VGAM2045 is therefore inhibition of LOC51667 (Accession NM_016118). Accordingly, utilities of VGAM2045 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51667. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2046 (VGAM2046) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71642] VGAM2046 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2046 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[71643] VGAM2046 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM2046 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71644] VGAM2046 gene encodes a VGAM2046 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2046 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2046 precursor RNA is designated SEQ ID:2032, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2032 is located at position 209917 relative to the genome of Human Herpesvirus 5.

[71645] VGAM2046 precursor RNA folds onto itself, forming VGAM2046 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71646] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2046 folded precursor RNA into VGAM2046 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM2046 RNA is designated SEQ ID:4757, and is provided hereinbelow with reference to the sequence listing part.

[71647] VGAM2046 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2046 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2046 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71648] VGAM2046 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2046 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2046 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2046 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2046 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71649] The complementary binding of VGAM2046 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2046 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2046 host target RNA into VGAM2046 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71650] It is appreciated that VGAM2046 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2046 host target genes. The mRNA of each one of this plurality of VGAM2046 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2046 RNA, herein designated VGAM RNA, and which when bound by VGAM2046 RNA causes inhibition of translation of respective one or more VGAM2046 host target proteins.

[71651] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2046 gene, herein designated VGAM GENE, on one or more VGAM2046 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71652] It is yet further appreciated that a function of VGAM2046 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2046 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2046 correlate with, and may be deduced from, the identity of the host target genes which VGAM2046 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71653] Nucleotide sequences of the VGAM2046 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2046 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2046 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2046 are further described hereinbelow with reference to Table 1.

[71654] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2046 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2046 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71655] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2046 gene, herein designated VGAM is inhibition of expression of VGAM2046 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2046 correlate with, and may be deduced from, the identity of the target genes which VGAM2046 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71656] G2A (Accession NM_013345) is a VGAM2046 host target gene. G2A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by G2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of G2A BINDING SITE, designated SEQ ID:14988, to the nucleotide sequence of VGAM2046 RNA, herein designated VGAM RNA, also designated SEQ ID:4757.

[71657] A function of VGAM2046 is therefore inhibition of G2A (Accession NM_013345), a gene which may mediate some of the effects of extracellular atp on insulin secretion. Accordingly, utilities of VGAM2046 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G2A. The function of G2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1965.Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2047 (VGAM2047) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71658] VGAM2047 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2047 was detected is described hereinabove with reference to Figs. 1-8.

[71659] VGAM2047 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM2047 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71660] VGAM2047 gene encodes a VGAM2047 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2047 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2047 precursor RNA is designated SEQ ID:2033, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2033 is located at position 202249 relative to the genome of Human Herpesvirus 5.

[71661] VGAM2047 precursor RNA folds onto itself, forming VGAM2047 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[71662] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2047 folded precursor RNA into VGAM2047 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2047 RNA is designated SEQ ID:4758, and is provided hereinbelow with reference to the sequence listing part.

[71663] VGAM2047 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2047 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2047 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71664] VGAM2047 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2047 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2047 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2047 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2047 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71665] The complementary binding of VGAM2047 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2047 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2047 host target RNA into VGAM2047 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71666] It is appreciated that VGAM2047 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2047 host target genes. The mRNA of each one of this plurality of VGAM2047 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2047 RNA, herein designated VGAM RNA, and which when bound by VGAM2047 RNA causes inhibition of translation of respective one or more VGAM2047 host target proteins.

[71667] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2047 gene, herein designated VGAM GENE, on one or more VGAM2047 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71668] It is yet further appreciated that a function of VGAM2047 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2047 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2047 correlate with, and may be deduced from, the identity of the host target genes which VGAM2047 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71669] Nucleotide sequences of the VGAM2047 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2047 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2047 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2047 are further described hereinbelow with reference to Table 1.

[71670] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2047 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2047 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71671] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2047 gene, herein designated VGAM is inhibition of expression of VGAM2047 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2047 correlate with, and may be deduced from, the identity of the target genes which VGAM2047 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71672] CAAX Box 1 (CXX1, Accession NM_003928) is a VGAM2047 host target gene. CXX1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CXX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of CXX1 BINDING SITE, designated SEQ ID:10023, to the nucleotide sequence of VGAM2047 RNA, herein designated VGAM RNA, also designated SEQ ID:4758.

[71673] A function of VGAM2047 is therefore inhibition of CAAX Box 1 (CXX1, Accession NM_003928). Accordingly, utilities of VGAM2047 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXX1. Death Effector Domain Containing (DEDD, Accession NM_032998) is another VGAM2047 host target gene. DEDD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DEDD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DEDD BINDING SITE, designated SEQ ID:26878, to the nucleotide sequence of VGAM2047 RNA, herein designated VGAM RNA, also designated SEQ ID:4758.

[71674] Another function of VGAM2047 is therefore inhibition of Death Effector Domain Containing (DEDD, Accession NM_032998), a gene which intervenes in apoptosis. Accordingly, utilities of VGAM2047 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with DEDD. The function of DEDD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1189.GDP Dissociation Inhibitor 1 (GDI1, Accession XM_010152) is another VGAM2047 host target gene. GDI1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GDI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GDI1 BINDING SITE, designated SEQ ID:30131, to the nucleotide sequence of VGAM2047 RNA, herein designated VGAM RNA, also designated SEQ ID:4758.

[71675] Another function of VGAM2047 is therefore inhibition of GDP Dissociation Inhibitor 1 (GDI1, Accession XM_010152). Accordingly, utilities of VGAM2047 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GDI1. Homeo Box C11 (HOXC11, Accession XM_012215) is another VGAM2047 host target gene. HOXC11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HOXC11, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXC11 BINDING SITE, designated SEQ ID:30210, to the nucleotide sequence of VGAM2047 RNA, herein designated VGAM RNA, also designated SEQ ID:4758.

[71676] Another function of VGAM2047 is therefore inhibition of Homeo Box C11 (HOXC11, Accession XM_012215), a gene which interacts with the lactase-phlorizin hydrolase promoter. Accordingly, utilities of VGAM2047 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXC11. The function of HOXC11 has been established by previous studies. See 142950 for general information on homeo box genes. HOXC11 is a member of the Hox C cluster on human chromosome 12 (Scott, 1992) and is homologous to the mouse Hoxc11 gene (previously called Hox3.7) which is located on chromosome 15. Using a yeast 1-hybrid screen designed to identify factors that bind to a portion of the lactase (LCT; 603202) gene promoter, Mitchelmore et al. (1998) identified a partial clone of HOXC11. They assembled the full-length HOXC11 cDNA using database searches and 5-prime RACE. The HOXC11 cDNA encodes

a 304-amino acid protein with a homeodomain and a C-terminal extension identical to those of mouse Hoxc11. The homeodomain of HOXC11 is most similar to the homeodomains of mouse Hoxa11, mouse Hoxd11, and Drosophila Abdominal-B genes. Using Northern blot analysis, Mitchelmore et al. (1998) detected a 2.1-kb HOXC11 transcript in HeLa cells. This expression was confirmed by ribonuclease protection assay. A second, 1.7-kb transcript, hypothesized to encode a protein lacking 114 amino acids at the HOXC11 N-terminal end, was detected in HeLa cells and Caco-2 intestinal cells. This smaller transcript becomes more abundant in Caco-2 cells after differentiation. Using RT-PCR, Mitchelmore et al. (1998) showed that HOXC11 is expressed in fetal tissues, including kidney, skeletal muscle, and small intestine. The expression in fetal small intestine was higher than that in small intestine from a 15-year old. Transfection studies using the C-terminal 190 amino acids of HOXC11 in HeLa cells demonstrated binding with similar affinity to the LCT promoter and an optimized Abdominal-B binding site. Both the long and short transcript forms of HOXC11 stimulated HNF1-alpha (OMIM Ref. No. 142410)-dependent transcription of LCT in cotransfection experiments.

[71677] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[71678] Mitchelmore, C.; Troelsen, J. T.; Sjostrom, H.; Noren, O. : The HOXC11 homeodomain protein interacts with the lactose-phlorizin hydrolase promoter and stimulates HNF1-alpha-dependent transcription. J. Biol. Chem. 273: 13297-13306, 1998. ; and

[71679] Scott, M. P. : Vertebrate homeobox gene nomenclature. Cell 71: 551-553, 1992.

[71680] Further studies establishing the function and utilities of HOXC11 are found in John Hopkins OMIM database record ID 605559, and in sited publications numbered 97 and 4377 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.PCTAIRE Protein Kinase 3 (PCTK3, Accession XM_053746) is another VGAM2047 host target gene. PCTK3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PCTK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCTK3 BINDING SITE, designated SEQ ID:36124, to the nucleotide sequence of

VGAM2047 RNA, herein designated VGAM RNA, also designated SEQ ID:4758.

[71681] Another function of VGAM2047 is therefore inhibition of PCTAIRE Protein Kinase 3 (PCTK3, Accession XM_053746), a gene which may play a role in signal transduction cascades in terminally differentiated cells. Accordingly, utilities of VGAM2047 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCTK3. The function of PCTK3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM132.Transcription Factor 19 (SC1) (TCF19, Accession XM_175167) is another VGAM2047 host target gene. TCF19 BINDING SITE1 and TCF19 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TCF19, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF19 BINDING SITE1 and TCF19 BINDING SITE2, designated SEQ ID:46659 and SEQ ID:46708 respectively, to the nucleotide sequence of VGAM2047 RNA, herein designated VGAM RNA, also designated SEQ ID:4758.

[71682] Another function of VGAM2047 is therefore inhibition of Transcription Factor 19 (SC1) (TCF19, Accession XM_175167), a gene which plays an important role in the transcription of genes required for the later stages of cell cycle progression. Accordingly, utilities of VGAM2047 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF19. The function of TCF19 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM299.Ubiquitin-conjugating Enzyme E2L 6 (UBE2L6, Accession NM_004223) is another VGAM2047 host target gene. UBE2L6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UBE2L6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2L6 BINDING SITE, designated SEQ ID:10419, to the nucleotide sequence of VGAM2047 RNA, herein designated VGAM RNA, also designated SEQ ID:4758.

[71683] Another function of VGAM2047 is therefore inhibition of Ubiquitin-conjugating Enzyme E2L 6 (UBE2L6, Accession

NM_004223), a gene which catalyzes the covalent attachment of ubiquitin to other proteins. Accordingly, utilities of VGAM2047 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2L6. The function of UBE2L6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1059.Zinc Finger Protein 236 (ZNF236, Accession NM_007345) is another VGAM2047 host target gene. ZNF236 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF236, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF236 BINDING SITE, designated SEQ ID:14274, to the nucleotide sequence of VGAM2047 RNA, herein designated VGAM RNA, also designated SEQ ID:4758.

[71684] Another function of VGAM2047 is therefore inhibition of Zinc Finger Protein 236 (ZNF236, Accession NM_007345). Accordingly, utilities of VGAM2047 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF236. DKFZP564B147 (Accession

XM_088745) is another VGAM2047 host target gene. DKFZP564B147 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP564B147, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564B147 BINDING SITE, designated SEQ ID:39934, to the nucleotide sequence of VGAM2047 RNA, herein designated VGAM RNA, also designated SEQ ID:4758.

[71685] Another function of VGAM2047 is therefore inhibition of DKFZP564B147 (Accession XM_088745). Accordingly, utilities of VGAM2047 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564B147. FLJ10352 (Accession NM_032142) is another VGAM2047 host target gene. FLJ10352 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10352 BINDING SITE, designated SEQ ID:25827, to the nucleotide sequence of VGAM2047 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4758.

[71686] Another function of VGAM2047 is therefore inhibition of FLJ10352 (Accession NM_032142). Accordingly, utilities of VGAM2047 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10352. KIAA0140 (Accession NM_014661) is another VGAM2047 host target gene. KIAA0140 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0140 BINDING SITE, designated SEQ ID:16109, to the nucleotide sequence of VGAM2047 RNA, herein designated VGAM RNA, also designated SEQ ID:4758.

[71687] Another function of VGAM2047 is therefore inhibition of KIAA0140 (Accession NM_014661). Accordingly, utilities of VGAM2047 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0140. KIAA0329 (Accession NM_014844) is another VGAM2047 host target gene. KIAA0329 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0329, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0329 BINDING SITE, designated SEQ ID:16879, to the nucleotide sequence of VGAM2047 RNA, herein designated VGAM RNA, also designated SEQ ID:4758.

[71688] Another function of VGAM2047 is therefore inhibition of KIAA0329 (Accession NM_014844). Accordingly, utilities of VGAM2047 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0329. KIAA0863 (Accession NM_014913) is another VGAM2047 host target gene. KIAA0863 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0863, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0863 BINDING SITE, designated SEQ ID:17154, to the nucleotide sequence of VGAM2047 RNA, herein designated VGAM RNA, also designated SEQ ID:4758.

[71689] Another function of VGAM2047 is therefore inhibition of KIAA0863 (Accession NM_014913). Accordingly, utilities of VGAM2047 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0863. Ras and Rab Interactor 3 (RIN3, Accession NM_024832) is another VGAM2047 host target gene. RIN3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RIN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RIN3 BINDING SITE, designated SEQ ID:24233, to the nucleotide sequence of VGAM2047 RNA, herein designated VGAM RNA, also designated SEQ ID:4758.

[71690] Another function of VGAM2047 is therefore inhibition of Ras and Rab Interactor 3 (RIN3, Accession NM_024832). Accordingly, utilities of VGAM2047 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RIN3. LOC144305 (Accession XM_096572) is another VGAM2047 host target gene. LOC144305 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144305 BINDING SITE, desig-

nated SEQ ID:40401, to the nucleotide sequence of VGAM2047 RNA, herein designated VGAM RNA, also designated SEQ ID:4758.

[71691] Another function of VGAM2047 is therefore inhibition of LOC144305 (Accession XM_096572). Accordingly, utilities of VGAM2047 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144305. LOC154877 (Accession XM_098626) is another VGAM2047 host target gene. LOC154877 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC154877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154877 BINDING SITE, designated SEQ ID:41740, to the nucleotide sequence of VGAM2047 RNA, herein designated VGAM RNA, also designated SEQ ID:4758.

[71692] Another function of VGAM2047 is therefore inhibition of LOC154877 (Accession XM_098626). Accordingly, utilities of VGAM2047 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154877. LOC157983 (Accession XM_088433) is another VGAM2047 host target gene. LOC157983 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157983, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157983 BINDING SITE, designated SEQ ID:39686, to the nucleotide sequence of VGAM2047 RNA, herein designated VGAM RNA, also designated SEQ ID:4758.

[71693] Another function of VGAM2047 is therefore inhibition of LOC157983 (Accession XM_088433). Accordingly, utilities of VGAM2047 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157983. LOC203289 (Accession XM_114672) is another VGAM2047 host target gene. LOC203289 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203289, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203289 BINDING SITE, designated SEQ ID:43028, to the nucleotide sequence of VGAM2047 RNA, herein designated VGAM RNA, also designated SEQ ID:4758.

[71694] Another function of VGAM2047 is therefore inhibition of

LOC203289 (Accession XM_114672). Accordingly, utilities of VGAM2047 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203289. LOC256544 (Accession XM_171228) is another VGAM2047 host target gene. LOC256544 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256544, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256544 BINDING SITE, designated SEQ ID:46015, to the nucleotide sequence of VGAM2047 RNA, herein designated VGAM RNA, also designated SEQ ID:4758.

[71695] Another function of VGAM2047 is therefore inhibition of LOC256544 (Accession XM_171228). Accordingly, utilities of VGAM2047 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256544. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2048 (VGAM2048) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[71696] VGAM2048 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2048 was detected is described hereinabove with reference to Figs. 1-8.

[71697] VGAM2048 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM2048 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71698] VGAM2048 gene encodes a VGAM2048 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2048 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2048 precursor RNA is designated SEQ ID:2034, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2034 is located at position 207766 relative to the genome of Human Herpesvirus 5.

[71699] VGAM2048 precursor RNA folds onto itself, forming VGAM2048 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71700] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2048 folded precursor RNA into VGAM2048 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2048 RNA is designated SEQ ID:4759, and is provided hereinbelow with reference to the sequence listing part.

[71701] VGAM2048 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2048 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2048 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71702] VGAM2048 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2048 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2048 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2048 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2048 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[71703] The complementary binding of VGAM2048 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2048 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2048 host target RNA into VGAM2048 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71704] It is appreciated that VGAM2048 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2048 host target genes. The mRNA of each one of this plurality of VGAM2048 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2048 RNA, herein designated VGAM RNA, and which when bound by VGAM2048 RNA causes inhibition of translation of respective one or more VGAM2048 host target proteins.

[71705] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2048 gene, herein designated VGAM GENE, on one

or more VGAM2048 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71706] It is yet further appreciated that a function of VGAM2048 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2048 correlate with, and may be deduced from, the identity of the host target genes which VGAM2048 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71707] Nucleotide sequences of the VGAM2048 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2048 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2048 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2048 are further described hereinbelow with reference to Table 1.

[71708] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2048 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2048 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71709] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2048 gene, herein designated VGAM is inhibition of expression of VGAM2048 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2048 correlate with, and may be deduced from, the identity of the target genes which VGAM2048 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71710] Coagulation Factor II (thrombin) Receptor-like 3 (F2RL3,

Accession NM_003950) is a VGAM2048 host target gene. F2RL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by F2RL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F2RL3 BINDING SITE, designated SEQ ID:10079, to the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71711] A function of VGAM2048 is therefore inhibition of Coagulation Factor II (thrombin) Receptor-like 3 (F2RL3, Accession NM_003950), a gene which Protease-activated receptor 4; G protein-coupled receptor that increases phosphoinositide hydrolysis. Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F2RL3. The function of F2RL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM193.Mannose-6-phosphate Receptor (cation dependent) (M6PR, Accession NM_002355) is another VGAM2048 host target gene. M6PR BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by M6PR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of M6PR BINDING SITE, designated SEQ ID:8163, to the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71712] Another function of VGAM2048 is therefore inhibition of Mannose-6-phosphate Receptor (cation dependent) (M6PR, Accession NM_002355), a gene which is nvolved in intracellular sorting and transport of acid hydrolases. Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with M6PR. The function of M6PR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1924.Nescient Helix Loop Helix 1 (NHLH1, Accession NM_005598) is another VGAM2048 host target gene. NHLH1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NHLH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NHLH1 BINDING SITE, designated SEQ ID:12123, to the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71713] Another function of VGAM2048 is therefore inhibition of Nescient Helix Loop Helix 1 (NHLH1, Accession NM_005598), a gene which may have a role in development of the nervous system. Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NHLH1. The function of NHLH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1923.CCR4-NOT Transcription Complex, Subunit 4 (CNOT4, Accession NM_013316) is another VGAM2048 host target gene. CNOT4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNOT4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNOT4 BINDING SITE, designated SEQ ID:14964, to the nucleotide sequence of

VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71714] Another function of VGAM2048 is therefore inhibition of CCR4-NOT Transcription Complex, Subunit 4 (CNOT4, Accession NM_013316). Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNOT4. EFA6R (Accession NM_015310) is another VGAM2048 host target gene. EFA6R BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EFA6R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFA6R BINDING SITE, designated SEQ ID:17621, to the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71715] Another function of VGAM2048 is therefore inhibition of EFA6R (Accession NM_015310). Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFA6R. FLJ20220 (Accession NM_017718) is another VGAM2048 host target gene. FLJ20220 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by FLJ20220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20220 BINDING SITE, designated SEQ ID:19303, to the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71716] Another function of VGAM2048 is therefore inhibition of FLJ20220 (Accession NM_017718). Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20220. FLJ20392 (Accession NM_017799) is another VGAM2048 host target gene. FLJ20392 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20392, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20392 BINDING SITE, designated SEQ ID:19444, to the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71717] Another function of VGAM2048 is therefore inhibition of

FLJ20392 (Accession NM_017799). Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20392. FLJ20445 (Accession NM_017824) is another VGAM2048 host target gene. FLJ20445 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20445 BINDING SITE, designated SEQ ID:19477, to the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71718] Another function of VGAM2048 is therefore inhibition of FLJ20445 (Accession NM_017824). Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20445. FLJ22596 (Accession NM_025086) is another VGAM2048 host target gene. FLJ22596 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ22596 BINDING SITE, designated SEQ ID:24701, to the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71719] Another function of VGAM2048 is therefore inhibition of FLJ22596 (Accession NM_025086). Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22596. KIAA1046 (Accession NM_014928) is another VGAM2048 host target gene. KIAA1046 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1046, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1046 BINDING SITE, designated SEQ ID:17216, to the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71720] Another function of VGAM2048 is therefore inhibition of KIAA1046 (Accession NM_014928). Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1046. Musculin (activated B-cell factor-1) (MSC, Ac-

cession XM_084266) is another VGAM2048 host target gene. MSC BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MSC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSC BINDING SITE, designated SEQ ID:37532, to the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71721] Another function of VGAM2048 is therefore inhibition of Musculin (activated B-cell factor-1) (MSC, Accession XM_084266). Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSC. PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM_028335) is another VGAM2048 host target gene. PRPF8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRPF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPF8 BINDING SITE, designated SEQ ID:30678, to the nucleotide sequence of VGAM2048 RNA,

herein designated VGAM RNA, also designated SEQ ID:4759.

[71722] Another function of VGAM2048 is therefore inhibition of PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM_028335). Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPF8. TBP-like 1 (TBPL1, Accession NM_004865) is another VGAM2048 host target gene. TBPL1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TBPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBPL1 BINDING SITE, designated SEQ ID:11289, to the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71723] Another function of VGAM2048 is therefore inhibition of TBP-like 1 (TBPL1, Accession NM_004865). Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBPL1. VPS39 (Accession XM_031720) is another VGAM2048 host target gene. VPS39 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by VPS39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS39 BINDING SITE, designated SEQ ID:31468, to the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71724] Another function of VGAM2048 is therefore inhibition of VPS39 (Accession XM_031720). Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS39. ZTL1 (Accession NM_024055) is another VGAM2048 host target gene. ZTL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZTL1 BINDING SITE, designated SEQ ID:23490, to the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71725] Another function of VGAM2048 is therefore inhibition of

ZTL1 (Accession NM_024055). Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZTL1. LOC150067 (Accession XM_016411) is another VGAM2048 host target gene. LOC150067 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150067, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150067 BINDING SITE, designated SEQ ID:30258, to the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71726] Another function of VGAM2048 is therefore inhibition of LOC150067 (Accession XM_016411). Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150067. LOC151057 (Accession XM_097998) is another VGAM2048 host target gene. LOC151057 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC151057 BINDING SITE, designated SEQ ID:41292, to the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71727] Another function of VGAM2048 is therefore inhibition of LOC151057 (Accession XM_097998). Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151057. LOC153443 (Accession XM_087669) is another VGAM2048 host target gene. LOC153443 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153443 BINDING SITE, designated SEQ ID:39373, to the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71728] Another function of VGAM2048 is therefore inhibition of LOC153443 (Accession XM_087669). Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153443. LOC197003 (Accession XM_113798) is an-

other VGAM2048 host target gene. LOC197003 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC197003, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197003 BINDING SITE, designated SEQ ID:42442, to the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71729] Another function of VGAM2048 is therefore inhibition of LOC197003 (Accession XM_113798). Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197003. LOC200205 (Accession XM_114152) is another VGAM2048 host target gene. LOC200205 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200205 BINDING SITE, designated SEQ ID:42734, to the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71730] Another function of VGAM2048 is therefore inhibition of LOC200205 (Accession XM_114152). Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200205. LOC219401 (Accession XM_166706) is another VGAM2048 host target gene. LOC219401 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219401 BINDING SITE, designated SEQ ID:44592, to the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71731] Another function of VGAM2048 is therefore inhibition of LOC219401 (Accession XM_166706). Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219401. LOC255126 (Accession XM_173585) is another VGAM2048 host target gene. LOC255126 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255126, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255126 BINDING SITE, designated SEQ ID:46550, to the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71732] Another function of VGAM2048 is therefore inhibition of LOC255126 (Accession XM_173585). Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255126. LOC51072 (Accession NM_015955) is another VGAM2048 host target gene. LOC51072 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC51072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51072 BINDING SITE, designated SEQ ID:18067, to the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71733] Another function of VGAM2048 is therefore inhibition of LOC51072 (Accession NM_015955). Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC51072. LOC90139 (Accession NM_130783) is another VGAM2048 host target gene. LOC90139 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90139 BINDING SITE, designated SEQ ID:28273, to the nucleotide sequence of VGAM2048 RNA, herein designated VGAM RNA, also designated SEQ ID:4759.

[71734] Another function of VGAM2048 is therefore inhibition of LOC90139 (Accession NM_130783). Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90139. LOC91373 (Accession XM_038063) is another VGAM2048 host target gene. LOC91373 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91373 BINDING SITE, designated SEQ ID:32750, to the nucleotide sequence of VGAM2048 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4759.

[71735] Another function of VGAM2048 is therefore inhibition of LOC91373 (Accession XM_038063). Accordingly, utilities of VGAM2048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91373. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2049 (VGAM2049) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71736] VGAM2049 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2049 was detected is described hereinabove with reference to Figs. 1-8.

[71737] VGAM2049 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM2049 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71738] VGAM2049 gene encodes a VGAM2049 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2049 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2049 precursor RNA is designated SEQ ID:2035, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2035 is located at position 196060 relative to the genome of Human Herpesvirus 5.

[71739] VGAM2049 precursor RNA folds onto itself, forming VGAM2049 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71740] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2049 folded precursor RNA into VGAM2049 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM2049 RNA is designated SEQ ID:4760, and is provided hereinbelow with reference to the sequence listing part.

[71741] VGAM2049 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2049 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2049 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71742] VGAM2049 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2049 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2049 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2049 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2049 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71743] The complementary binding of VGAM2049 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2049 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2049 host target RNA into VGAM2049 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71744] It is appreciated that VGAM2049 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2049 host target genes. The mRNA of

each one of this plurality of VGAM2049 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2049 RNA, herein designated VGAM RNA, and which when bound by VGAM2049 RNA causes inhibition of translation of respective one or more VGAM2049 host target proteins.

[71745] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2049 gene, herein designated VGAM GENE, on one or more VGAM2049 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[71746] It is yet further appreciated that a function of VGAM2049 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2049 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2049 correlate with, and may be deduced from, the identity of the host target genes which VGAM2049 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71747] Nucleotide sequences of the VGAM2049 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2049 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2049 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2049 are further described hereinbelow with reference to Table 1.

[71748] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2049 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2049 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71749] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2049 gene, herein designated VGAM is inhibition of expression of VGAM2049 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2049 correlate with, and may be deduced from, the identity of the target genes which VGAM2049 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71750] Complement Component 7 (C7, Accession NM_000587) is a VGAM2049 host target gene. C7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C7 BINDING SITE, designated SEQ ID:6192, to the nucleotide sequence of VGAM2049 RNA, herein designated VGAM RNA, also designated SEQ ID:4760.

[71751] A function of VGAM2049 is therefore inhibition of Complement Component 7 (C7, Accession NM_000587). Accordingly, utilities of VGAM2049 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with C7. Dual Specificity Phosphatase 5 (DUSP5, Accession NM_004419) is another VGAM2049 host target gene. DUSP5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DUSP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP5 BINDING SITE, designated SEQ ID:10686, to the nucleotide sequence of VGAM2049 RNA, herein designated VGAM RNA, also designated SEQ ID:4760.

[71752] Another function of VGAM2049 is therefore inhibition of Dual Specificity Phosphatase 5 (DUSP5, Accession NM_004419), a gene which displays phosphatase activity toward several substrates. Accordingly, utilities of VGAM2049 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP5. The function of DUSP5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM538.DKFZP564C103 (Accession NM_015654) is another VGAM2049 host target gene. DKFZP564C103

BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564C103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564C103 BINDING SITE, designated SEQ ID:17901, to the nucleotide sequence of VGAM2049 RNA, herein designated VGAM RNA, also designated SEQ ID:4760.

[71753] Another function of VGAM2049 is therefore inhibition of DKFZP564C103 (Accession NM_015654). Accordingly, utilities of VGAM2049 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564C103. KIAA0561 (Accession XM_038150) is another VGAM2049 host target gene. KIAA0561 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0561, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0561 BINDING SITE, designated SEQ ID:32762, to the nucleotide sequence of VGAM2049 RNA, herein designated VGAM RNA, also designated SEQ ID:4760.

[71754] Another function of VGAM2049 is therefore inhibition of KIAA0561 (Accession XM_038150). Accordingly, utilities of VGAM2049 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0561. KIAA0935 (Accession XM_052620) is another VGAM2049 host target gene. KIAA0935 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0935, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0935 BINDING SITE, designated SEQ ID:36012, to the nucleotide sequence of VGAM2049 RNA, herein designated VGAM RNA, also designated SEQ ID:4760.

[71755] Another function of VGAM2049 is therefore inhibition of KIAA0935 (Accession XM_052620). Accordingly, utilities of VGAM2049 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0935. Protein Phosphatase 4, Regulatory Subunit 1-like (PPP4R1L, Accession XM_086650) is another VGAM2049 host target gene. PPP4R1L BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PPP4R1L, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP4R1L BINDING SITE, designated SEQ ID:38816, to the nucleotide sequence of VGAM2049 RNA, herein designated VGAM RNA, also designated SEQ ID:4760.

[71756] Another function of VGAM2049 is therefore inhibition of Protein Phosphatase 4, Regulatory Subunit 1-like (PPP4R1L, Accession XM_086650). Accordingly, utilities of VGAM2049 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP4R1L. ZAK (Accession NM_016653) is another VGAM2049 host target gene. ZAK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZAK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZAK BINDING SITE, designated SEQ ID:18778, to the nucleotide sequence of VGAM2049 RNA, herein designated VGAM RNA, also designated SEQ ID:4760.

[71757] Another function of VGAM2049 is therefore inhibition of ZAK (Accession NM_016653). Accordingly, utilities of

VGAM2049 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZAK. LOC149566 (Accession XM_097670) is another VGAM2049 host target gene. LOC149566 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149566, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149566 BINDING SITE, designated SEQ ID:41012, to the nucleotide sequence of VGAM2049 RNA, herein designated VGAM RNA, also designated SEQ ID:4760.

[71758] Another function of VGAM2049 is therefore inhibition of LOC149566 (Accession XM_097670). Accordingly, utilities of VGAM2049 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149566. LOC150368 (Accession XM_086826) is another VGAM2049 host target gene. LOC150368 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150368, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC150368 BINDING SITE, designated SEQ ID:38911, to the nucleotide sequence of VGAM2049 RNA, herein designated VGAM RNA, also designated SEQ ID:4760.

[71759] Another function of VGAM2049 is therefore inhibition of LOC150368 (Accession XM_086826). Accordingly, utilities of VGAM2049 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150368. LOC255718 (Accession XM_174148) is another VGAM2049 host target gene. LOC255718 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255718, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255718 BINDING SITE, designated SEQ ID:46582, to the nucleotide sequence of VGAM2049 RNA, herein designated VGAM RNA, also designated SEQ ID:4760.

[71760] Another function of VGAM2049 is therefore inhibition of LOC255718 (Accession XM_174148). Accordingly, utilities of VGAM2049 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255718. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2050 (VGAM2050) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71761] VGAM2050 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2050 was detected is described hereinabove with reference to Figs. 1-8.

[71762] VGAM2050 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ovine Adenovirus A. VGAM2050 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71763] VGAM2050 gene encodes a VGAM2050 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2050 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2050 precursor RNA is designated SEQ ID:2036, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2036 is located at position 13096 relative to the

genome of Ovine Adenovirus A.

[71764] VGAM2050 precursor RNA folds onto itself, forming VGAM2050 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71765] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2050 folded precursor RNA into VGAM2050 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM2050 RNA is designated SEQ ID:4761, and is provided hereinbelow with reference to the sequence listing part.

[71766] VGAM2050 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2050 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2050 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71767] VGAM2050 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2050 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2050 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2050 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2050 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71768] The complementary binding of VGAM2050 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2050 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2050 host target RNA into VGAM2050 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71769] It is appreciated that VGAM2050 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2050 host target genes. The mRNA of each one of this plurality of VGAM2050 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2050 RNA, herein designated VGAM RNA, and which when bound by VGAM2050 RNA causes inhibition of translation of respective one or more VGAM2050 host target proteins.

[71770] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2050 gene, herein designated VGAM GENE, on one or more VGAM2050 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71771] It is yet further appreciated that a function of VGAM2050 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2050 include diagnosis, prevention and treatment of viral infection by Ovine Adenovirus A. Specific functions, and accordingly utilities, of VGAM2050

correlate with, and may be deduced from, the identity of the host target genes which VGAM2050 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71772] Nucleotide sequences of the VGAM2050 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2050 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2050 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2050 are further described hereinbelow with reference to Table 1.

[71773] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2050 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2050 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71774] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2050 gene, herein designated VGAM is inhibition of expression of VGAM2050 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2050 correlate with, and may be deduced

from, the identity of the target genes which VGAM2050 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71775] KIAA0820 (Accession XM_044463) is a VGAM2050 host target gene. KIAA0820 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0820 BINDING SITE, designated SEQ ID:34215, to the nucleotide sequence of VGAM2050 RNA, herein designated VGAM RNA, also designated SEQ ID:4761.

[71776] A function of VGAM2050 is therefore inhibition of KIAA0820 (Accession XM_044463). Accordingly, utilities of VGAM2050 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0820. LOC205327 (Accession XM_115788) is another VGAM2050 host target gene. LOC205327 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC205327, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC205327 BINDING SITE, designated SEQ ID:43103, to the nucleotide sequence of VGAM2050 RNA, herein designated VGAM RNA, also designated SEQ ID:4761.

[71777] Another function of VGAM2050 is therefore inhibition of LOC205327 (Accession XM_115788). Accordingly, utilities of VGAM2050 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205327. LOC222681 (Accession XM_167116) is another VGAM2050 host target gene. LOC222681 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222681 BINDING SITE, designated SEQ ID:44607, to the nucleotide sequence of VGAM2050 RNA, herein designated VGAM RNA, also designated SEQ ID:4761.

[71778] Another function of VGAM2050 is therefore inhibition of LOC222681 (Accession XM_167116). Accordingly, utilities of VGAM2050 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222681. LOC257507 (Accession XM_175204) is an-

other VGAM2050 host target gene. LOC257507 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257507 BINDING SITE, designated SEQ ID:46673, to the nucleotide sequence of VGAM2050 RNA, herein designated VGAM RNA, also designated SEQ ID:4761.

[71779] Another function of VGAM2050 is therefore inhibition of LOC257507 (Accession XM_175204). Accordingly, utilities of VGAM2050 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257507. LOC257625 (Accession XM_175267) is another VGAM2050 host target gene. LOC257625 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257625, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257625 BINDING SITE, designated SEQ ID:46729, to the nucleotide sequence of VGAM2050 RNA, herein designated VGAM RNA, also designated SEQ ID:4761.

[71780] Another function of VGAM2050 is therefore inhibition of LOC257625 (Accession XM_175267). Accordingly, utilities of VGAM2050 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257625. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2051 (VGAM2051) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71781] VGAM2051 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2051 was detected is described hereinabove with reference to Figs. 1-8.

[71782] VGAM2051 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ovine Adenovirus A. VGAM2051 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71783] VGAM2051 gene encodes a VGAM2051 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2051 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2051 precursor RNA is designated SEQ ID:2037, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2037 is located at position 24505 relative to the genome of Ovine Adenovirus A.

[71784] VGAM2051 precursor RNA folds onto itself, forming VGAM2051 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71785] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2051 folded precursor RNA into VGAM2051 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 81%) nucleotide sequence of VGAM2051 RNA is designated SEQ ID:4762, and is provided hereinbelow with reference to the sequence listing part.

[71786] VGAM2051 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2051 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2051 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71787] VGAM2051 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2051 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2051 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2051 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2051 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71788] The complementary binding of VGAM2051 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2051 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2051 host target RNA into VGAM2051 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71789] It is appreciated that VGAM2051 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2051 host target genes. The mRNA of each one of this plurality of VGAM2051 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2051 RNA, herein designated VGAM RNA, and which when bound by VGAM2051 RNA causes inhibition of translation of respective one or more VGAM2051 host target proteins.

[71790] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2051 gene, herein designated VGAM GENE, on one or more VGAM2051 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71791] It is yet further appreciated that a function of VGAM2051 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2051 include diagnosis, prevention and treatment of viral infection by Ovine Adenovirus A. Specific functions, and accordingly utilities, of VGAM2051 correlate with, and may be deduced from, the identity of the host target genes which VGAM2051 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71792] Nucleotide sequences of the VGAM2051 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2051 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2051 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2051 are further described hereinbelow with reference to Table 1.

[71793] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2051 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2051 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[71794] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2051 gene, herein designated VGAM is inhibition of expression of VGAM2051 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2051 correlate with, and may be deduced from, the identity of the target genes which VGAM2051 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71795] Mitogen-activated Protein Kinase Kinase Kinase 14 (MAP3K14, Accession NM_003954) is a VGAM2051 host target gene. MAP3K14 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAP3K14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K14 BINDING SITE, designated SEQ ID:10089, to the nucleotide sequence of VGAM2051 RNA, herein designated VGAM RNA, also designated SEQ ID:4762.

[71796] A function of VGAM2051 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 14 (MAP3K14, Accession NM_003954), a gene which is involved in the

activation of nf-kappa-b and its transcriptional activity. induces the processing of nf-kappa-b 2/p100. could act in a receptor-selective manner (by similarity). Accordingly, utilities of VGAM2051 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K14. The function of MAP3K14 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.Methionine Adenosyltransferase II, Alpha (MAT2A, Accession NM_005911) is another VGAM2051 host target gene. MAT2A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAT2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAT2A BINDING SITE, designated SEQ ID:12543, to the nucleotide sequence of VGAM2051 RNA, herein designated VGAM RNA, also designated SEQ ID:4762.

[71797] Another function of VGAM2051 is therefore inhibition of Methionine Adenosyltransferase II, Alpha (MAT2A, Accession NM_005911), a gene which catalyzes the biosynthesis of S-adenosylmethionine (AdoMet) from methionine

and ATP. Accordingly, utilities of VGAM2051 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAT2A. The function of MAT2A has been established by previous studies. Methionine adenosyltransferase (EC 2.5.1.6) catalyzes the biosynthesis of S-adenosylmethionine (OMIM Ref. No. AdoMet) from methionine and ATP. AdoMet is the major methyl donor for many of the transmethylation reactions in the body. Chamberlin et al. (1996) noted that AdoMet also participates in the transsulfuration pathway and, after decarboxylation, serves as a propylamine group donor in the biosynthesis of polyamines. Three forms of MAT have been identified in mammalian tissues. MAT I and MAT III, which are encoded by the single-copy MAT1A gene (OMIM Ref. No. 250850), represent tetramers and dimers, respectively, formed from identical alpha-1 subunits and are synthesized primarily in the liver. MAT II, encoded by a separate gene, which was cloned by Horikawa and Tsukada (1992), is found in fetal liver (and to a lesser extent in adult liver) as well as in kidney, brain, testis, and lymphocytes. Horikawa and Tsukada (1992) showed that the 395-amino acid MAT II shares 84% amino acid similarity with the human liver MAT I/III protein. Mao et al.

(1998) cloned the 5-prime flanking region of the MAT2A gene. They identified 2 major transcriptional start sites, one located within 10 nucleotides downstream and the other 158 nucleotides upstream from the TATA box. The MAT2A promoter is highly GC rich, especially in the first 300 bp. The promoter contains several potential SP1-, v-myb-, and GATA-binding sites, as well as potential binding sites for C/EBP, HSF2, c-myb, and STATx. Mao et al. (1998) showed that the MAT2A promoter can efficiently drive expression from a reporter gene in both Jurkat and 293 cells. The authors identified regions of the promoter that are important for cell-specific MAT2A expression. By in situ hybridization, De La Rosa et al. (1995) mapped the MATA2 gene to 2p11.2.

[71798] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[71799] Chamberlin, M. E.; Ubagai, T.; Mudd, S. H.; Wilson, W. G.; Leonard, J. V.; Chou, J. Y. : Demyelination of the brain is associated with methionine adenosyltransferase I/III deficiency. J. Clin. Invest. 98: 1021-1027, 1996. ; and

[71800] De La Rosa, J.; Ostrowski, J.; Hryniewicz, M. M.; Kredich, N. M.; Kotb, M.; LeGros, H. L., Jr.; Valentine, M.; Geller, A. M.

: Chromosomal localization and catalytic properties of the r.

[71801] Further studies establishing the function and utilities of MAT2A are found in John Hopkins OMIM database record ID 601468, and in sited publications numbered 907 and 6689-6690 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.N-ethylmaleimide-sensitive Factor (NSF, Accession XM_032173) is another VGAM2051 host target gene. NSF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NSF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NSF BINDING SITE, designated SEQ ID:31587, to the nucleotide sequence of VGAM2051 RNA, herein designated VGAM RNA, also designated SEQ ID:4762.

[71802] Another function of VGAM2051 is therefore inhibition of N-ethylmaleimide-sensitive Factor (NSF, Accession XM_032173), a gene which catalyzes the fusion of transport vesicles within the golgi cisternae. Accordingly, utilities of VGAM2051 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with NSF. The function of NSF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM370.Pyrimidinergic Receptor P2Y, G-protein Coupled, 6 (P2RY6, Accession NM_004154) is another VGAM2051 host target gene. P2RY6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by P2RY6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RY6 BINDING SITE, designated SEQ ID:10353, to the nucleotide sequence of VGAM2051 RNA, herein designated VGAM RNA, also designated SEQ ID:4762.

[71803] Another function of VGAM2051 is therefore inhibition of Pyrimidinergic Receptor P2Y, G-protein Coupled, 6 (P2RY6, Accession NM_004154), a gene which mediates cellular responses to nucleotides. Accordingly, utilities of VGAM2051 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RY6. The function of P2RY6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM445.Ring Finger Protein 26 (RNF26, Accession NM_032015) is another VGAM2051 host target gene. RNF26 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNF26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF26 BINDING SITE, designated SEQ ID:25727, to the nucleotide sequence of VGAM2051 RNA, herein designated VGAM RNA, also designated SEQ ID:4762.

[71804] Another function of VGAM2051 is therefore inhibition of Ring Finger Protein 26 (RNF26, Accession NM_032015). Accordingly, utilities of VGAM2051 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF26. Carboxylesterase 2 (intestine, liver) (CES2, Accession NM_003869) is another VGAM2051 host target gene. CES2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CES2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CES2 BINDING SITE,

designated SEQ ID:9956, to the nucleotide sequence of VGAM2051 RNA, herein designated VGAM RNA, also designated SEQ ID:4762.

[71805] Another function of VGAM2051 is therefore inhibition of Carboxylesterase 2 (intestine, liver) (CES2, Accession NM_003869). Accordingly, utilities of VGAM2051 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CES2. FLJ14642 (Accession NM_032818) is another VGAM2051 host target gene. FLJ14642 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14642, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14642 BINDING SITE, designated SEQ ID:26594, to the nucleotide sequence of VGAM2051 RNA, herein designated VGAM RNA, also designated SEQ ID:4762.

[71806] Another function of VGAM2051 is therefore inhibition of FLJ14642 (Accession NM_032818). Accordingly, utilities of VGAM2051 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14642. HSNOV1 (Accession NM_017515) is another

VGAM2051 host target gene. HSNOV1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSNOV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSNOV1 BINDING SITE, designated SEQ ID:18964, to the nucleotide sequence of VGAM2051 RNA, herein designated VGAM RNA, also designated SEQ ID:4762.

[71807] Another function of VGAM2051 is therefore inhibition of HSNOV1 (Accession NM_017515). Accordingly, utilities of VGAM2051 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSNOV1. KIAA0757 (Accession NM_006038) is another VGAM2051 host target gene. KIAA0757 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0757, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0757 BINDING SITE, designated SEQ ID:12670, to the nucleotide sequence of VGAM2051 RNA, herein designated VGAM RNA, also designated SEQ ID:4762.

[71808] Another function of VGAM2051 is therefore inhibition of KIAA0757 (Accession NM_006038). Accordingly, utilities of VGAM2051 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0757. NDRG Family Member 4 (NDRG4, Accession NM_020465) is another VGAM2051 host target gene. NDRG4 BINDING SITE1 and NDRG4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NDRG4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDRG4 BINDING SITE1 and NDRG4 BINDING SITE2, designated SEQ ID:21696 and SEQ ID:23211 respectively, to the nucleotide sequence of VGAM2051 RNA, herein designated VGAM RNA, also designated SEQ ID:4762.

[71809] Another function of VGAM2051 is therefore inhibition of NDRG Family Member 4 (NDRG4, Accession NM_020465). Accordingly, utilities of VGAM2051 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG4. LOC145497 (Accession XM_085150) is another VGAM2051 host target gene. LOC145497 BINDING SITE is HOST TARGET binding site

found in the 5` untranslated region of mRNA encoded by LOC145497, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145497 BINDING SITE, designated SEQ ID:37872, to the nucleotide sequence of VGAM2051 RNA, herein designated VGAM RNA, also designated SEQ ID:4762.

[71810] Another function of VGAM2051 is therefore inhibition of LOC145497 (Accession XM_085150). Accordingly, utilities of VGAM2051 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145497. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2052 (VGAM2052) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71811] VGAM2052 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2052 was detected is described hereinabove with reference to Figs. 1-8.

[71812] VGAM2052 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ovine Adenovirus A. VGAM2052 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71813] VGAM2052 gene encodes a VGAM2052 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2052 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2052 precursor RNA is designated SEQ ID:2038, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2038 is located at position 28963 relative to the genome of Ovine Adenovirus A.

[71814] VGAM2052 precursor RNA folds onto itself, forming VGAM2052 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[71815] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2052 folded precursor RNA into VGAM2052 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM2052 RNA is designated SEQ ID:4763, and is provided hereinbelow with reference to the sequence listing part.

[71816] VGAM2052 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2052 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2052 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71817] VGAM2052 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2052 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2052 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2052 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2052 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71818] The complementary binding of VGAM2052 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2052 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2052 host target RNA into VGAM2052 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71819] It is appreciated that VGAM2052 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2052 host target genes. The mRNA of each one of this plurality of VGAM2052 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2052 RNA, herein designated VGAM RNA, and which when bound by VGAM2052 RNA causes inhibition of translation of respective one or more VGAM2052 host target proteins.

[71820] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2052 gene, herein designated VGAM GENE, on one or more VGAM2052 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71821] It is yet further appreciated that a function of VGAM2052 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of viral infection by Ovine Adenovirus A. Specific functions, and accordingly utilities, of VGAM2052 correlate with, and may be deduced from, the identity of the host target genes which VGAM2052 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71822] Nucleotide sequences of the VGAM2052 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2052 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2052 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2052 are further described hereinbelow with reference to Table 1.

[71823] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2052 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2052 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71824] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2052 gene, herein designated VGAM is inhibition of expression of VGAM2052 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2052 correlate with, and may be deduced from, the identity of the target genes which VGAM2052 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71825] Adaptor-related Protein Complex 2, Beta 1 Subunit (AP2B1, Accession NM_001282) is a VGAM2052 host target gene. AP2B1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AP2B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of AP2B1 BINDING SITE, designated SEQ ID:6951, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71826] A function of VGAM2052 is therefore inhibition of Adaptor-related Protein Complex 2, Beta 1 Subunit (AP2B1, Accession NM_001282), a gene which links clathrin to receptors in coated vesicles. Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP2B1. The function of AP2B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1126.Cadherin 1, Type 1, E-cadherin (epithelial) (CDH1, Accession NM_004360) is another VGAM2052 host target gene. CDH1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH1 BINDING SITE, designated SEQ ID:10565, to the nucleotide sequence of VGAM2052 RNA,

herein designated VGAM RNA, also designated SEQ ID:4763.

[71827] Another function of VGAM2052 is therefore inhibition of Cadherin 1, Type 1, E-cadherin (epithelial) (CDH1, Accession NM_004360). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH1. Decorin (DCN, Accession NM_001920) is another VGAM2052 host target gene. DCN BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DCN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCN BINDING SITE, designated SEQ ID:7635, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71828] Another function of VGAM2052 is therefore inhibition of Decorin (DCN, Accession NM_001920), a gene which may mediate in epithelial/mesenchymal interactions . Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCN. The function of DCN and its association with various diseases and clinical conditions, has been es-

tablished by previous studies, as described hereinabove with reference to VGAM1326.High Mobility Group AT-hook 2 (HMGA2, Accession NM_003483) is another VGAM2052 host target gene. HMGA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HMGA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGA2 BINDING SITE, designated SEQ ID:9571, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71829] Another function of VGAM2052 is therefore inhibition of High Mobility Group AT-hook 2 (HMGA2, Accession NM_003483), a gene which may affect transcription and cell differentiation; shares common DNA-binding motif with other HMG HMG I/Y family members. Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGA2. The function of HMGA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM552.Interferon (alpha, beta and

omega) Receptor 2 (IFNAR2, Accession NM_000874) is another VGAM2052 host target gene. IFNAR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IFNAR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IFNAR2 BINDING SITE, designated SEQ ID:6553, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71830] Another function of VGAM2052 is therefore inhibition of Interferon (alpha, beta and omega) Receptor 2 (IFNAR2, Accession NM_000874), a gene which is a receptor for interferons alpha and beta. Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IFNAR2. The function of IFNAR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM487.Integrin, Beta-like 1 (with EGF-like repeat domains) (ITGBL1, Accession NM_004791) is another VGAM2052 host target gene. ITGBL1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by ITGBL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGBL1 BINDING SITE, designated SEQ ID:11200, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71831] Another function of VGAM2052 is therefore inhibition of Integrin, Beta-like 1 (with EGF-like repeat domains) (ITGBL1, Accession NM_004791). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGBL1. MLL Septin-like Fusion (MSF, Accession XM_113892) is another VGAM2052 host target gene. MSF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MSF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSF BINDING SITE, designated SEQ ID:42524, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71832] Another function of VGAM2052 is therefore inhibition of

MLL Septin-like Fusion (MSF, Accession XM_113892), a gene which plays a role in the cell cycle. Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSF. The function of MSF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM514.Protocadherin Alpha 9 (PCDHA9, Accession NM_014005) is another VGAM2052 host target gene. PCDHA9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDHA9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE, designated SEQ ID:15212, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71833] Another function of VGAM2052 is therefore inhibition of Protocadherin Alpha 9 (PCDHA9, Accession NM_014005), a gene which is a calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with PCDHA9. The function of PCDHA9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM71.Protease, Serine, 16 (thymus) (PRSS16, Accession NM_005865) is another VGAM2052 host target gene. PRSS16 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRSS16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRSS16 BINDING SITE, designated SEQ ID:12481, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71834] Another function of VGAM2052 is therefore inhibition of Protease, Serine, 16 (thymus) (PRSS16, Accession NM_005865). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRSS16. Protein Tyrosine Phosphatase, Receptor Type, F (PTPRF, Accession NM_130440) is another VGAM2052 host target gene. PTPRF BINDING SITE1 and PTPRF BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of

mRNA encoded by PTPRF, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRF BINDING SITE1 and PTPRF BINDING SITE2, designated SEQ ID:28197 and SEQ ID:8723 respectively, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71835] Another function of VGAM2052 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, F (PTPRF, Accession NM_130440), a gene which negatively regulates the insulin signaling pathway. Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRF. The function of PTPRF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1105.SON DNA Binding Protein (SON, Accession NM_138926) is another VGAM2052 host target gene. SON BINDING SITE1 through SON BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SON, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SON BINDING SITE1 through SON BINDING SITE3, designated SEQ ID:29042, SEQ ID:29046 and SEQ ID:27746 respectively, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71836] Another function of VGAM2052 is therefore inhibition of SON DNA Binding Protein (SON, Accession NM_138926). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SON. TAF7-like RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 50kDa (TAF7L, Accession NM_024885) is another VGAM2052 host target gene. TAF7L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAF7L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF7L BINDING SITE, designated SEQ ID:24338, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71837] Another function of VGAM2052 is therefore inhibition of

TAF7-like RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 50kDa (TAF7L, Accession NM_024885). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF7L. Transcription Factor AP-4 (activating enhancer binding protein 4) (TFAP4, Accession NM_003223) is another VGAM2052 host target gene. TFAP4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TFAP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFAP4 BINDING SITE, designated SEQ ID:9226, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71838] Another function of VGAM2052 is therefore inhibition of Transcription Factor AP-4 (activating enhancer binding protein 4) (TFAP4, Accession NM_003223), a gene which activates both viral and cellular genes by binding to the symmetrical dna sequence 5'-cagctg-3'. Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with TFAP4. The function of TFAP4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM175.WWP2 (Accession XM_028151) is another VGAM2052 host target gene. WWP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WWP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WWP2 BINDING SITE, designated SEQ ID:30624, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71839] Another function of VGAM2052 is therefore inhibition of WWP2 (Accession XM_028151), a gene which exhibits ubiquitin-protein ligase activity and contains WW and HECT domains. Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WWP2. The function of WWP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1959.Apolipoprotein A-V (APOA5, Accession

NM_052968) is another VGAM2052 host target gene. APOA5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by APOA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOA5 BINDING SITE, designated SEQ ID:27538, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71840] Another function of VGAM2052 is therefore inhibition of Apolipoprotein A-V (APOA5, Accession NM_052968). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOA5. Destrin (actin depolymerizing factor) (DSTN, Accession NM_006870) is another VGAM2052 host target gene. DSTN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DSTN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSTN BINDING SITE, designated SEQ ID:13741, to the nucleotide sequence of

VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71841] Another function of VGAM2052 is therefore inhibition of Destrin (actin depolymerizing factor) (DSTN, Accession NM_006870). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSTN. FLJ10081 (Accession NM_017991) is another VGAM2052 host target gene. FLJ10081 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10081, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10081 BINDING SITE, designated SEQ ID:19722, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71842] Another function of VGAM2052 is therefore inhibition of FLJ10081 (Accession NM_017991). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10081. FLJ11726 (Accession NM_024971) is another VGAM2052 host target gene. FLJ11726 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11726, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11726 BINDING SITE, designated SEQ ID:24525, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71843] Another function of VGAM2052 is therefore inhibition of FLJ11726 (Accession NM_024971). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11726. FLJ14327 (Accession NM_024912) is another VGAM2052 host target gene. FLJ14327 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14327, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14327 BINDING SITE, designated SEQ ID:24423, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71844] Another function of VGAM2052 is therefore inhibition of

FLJ14327 (Accession NM_024912). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14327. ICK (Accession NM_014920) is another VGAM2052 host target gene. ICK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ICK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICK BINDING SITE, designated SEQ ID:17194, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71845] Another function of VGAM2052 is therefore inhibition of ICK (Accession NM_014920). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICK. KIAA0532 (Accession XM_047659) is another VGAM2052 host target gene. KIAA0532 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0532, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0532 BINDING SITE, designated SEQ ID:35022, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71846] Another function of VGAM2052 is therefore inhibition of KIAA0532 (Accession XM_047659). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0532. KIAA0682 (Accession NM_014852) is another VGAM2052 host target gene. KIAA0682 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0682 BINDING SITE, designated SEQ ID:16901, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71847] Another function of VGAM2052 is therefore inhibition of KIAA0682 (Accession NM_014852). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0682. KIAA0766 (Accession NM_014805) is another

VGAM2052 host target gene. KIAA0766 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0766 BINDING SITE, designated SEQ ID:16744, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71848] Another function of VGAM2052 is therefore inhibition of KIAA0766 (Accession NM_014805). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0766. KIAA1045 (Accession XM_048592) is another VGAM2052 host target gene. KIAA1045 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1045 BINDING SITE, designated SEQ ID:35199, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71849] Another function of VGAM2052 is therefore inhibition of KIAA1045 (Accession XM_048592). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1045. KIAA1184 (Accession NM_022572) is another VGAM2052 host target gene. KIAA1184 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1184, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1184 BINDING SITE, designated SEQ ID:22894, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71850] Another function of VGAM2052 is therefore inhibition of KIAA1184 (Accession NM_022572). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1184. KIAA1579 (Accession NM_018211) is another VGAM2052 host target gene. KIAA1579 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1579, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1579 BINDING SITE, designated SEQ ID:20119, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71851] Another function of VGAM2052 is therefore inhibition of KIAA1579 (Accession NM_018211). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1579. KIAA1908 (Accession XM_055834) is another VGAM2052 host target gene. KIAA1908 BINDING SITE1 and KIAA1908 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1908, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1908 BINDING SITE1 and KIAA1908 BINDING SITE2, designated SEQ ID:36328 and SEQ ID:36338 respectively, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71852] Another function of VGAM2052 is therefore inhibition of KIAA1908 (Accession XM_055834). Accordingly, utilities

of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1908. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM_028840) is another VGAM2052 host target gene. PPP1R16B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP1R16B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R16B BINDING SITE, designated SEQ ID:30776, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71853] Another function of VGAM2052 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM_028840). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R16B. Syndecan Binding Protein (syntenin) (SDCBP, Accession NM_005625) is another VGAM2052 host target gene. SDCBP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SDCBP, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDCBP BINDING SITE, designated SEQ ID:12135, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71854] Another function of VGAM2052 is therefore inhibition of Syndecan Binding Protein (syntenin) (SDCBP, Accession NM_005625). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDCBP. SE70-2 (Accession NM_022118) is another VGAM2052 host target gene. SE70-2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SE70-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SE70-2 BINDING SITE, designated SEQ ID:22663, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71855] Another function of VGAM2052 is therefore inhibition of SE70-2 (Accession NM_022118). Accordingly, utilities of

VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SE70-2. LOC112476 (Accession NM_145239) is another VGAM2052 host target gene. LOC112476 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC112476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112476 BINDING SITE, designated SEQ ID:29752, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71856] Another function of VGAM2052 is therefore inhibition of LOC112476 (Accession NM_145239). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112476. LOC115399 (Accession XM_055874) is another VGAM2052 host target gene. LOC115399 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC115399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC115399 BINDING SITE, designated SEQ ID:36345, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71857] Another function of VGAM2052 is therefore inhibition of LOC115399 (Accession XM_055874). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115399. LOC130595 (Accession XM_065793) is another VGAM2052 host target gene. LOC130595 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC130595, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130595 BINDING SITE, designated SEQ ID:37299, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71858] Another function of VGAM2052 is therefore inhibition of LOC130595 (Accession XM_065793). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130595. LOC134266 (Accession XM_059701) is another VGAM2052 host target gene. LOC134266 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC134266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134266 BINDING SITE, designated SEQ ID:37071, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71859] Another function of VGAM2052 is therefore inhibition of LOC134266 (Accession XM_059701). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134266. LOC149103 (Accession XM_086434) is another VGAM2052 host target gene. LOC149103 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149103 BINDING SITE, designated SEQ ID:38653, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71860] Another function of VGAM2052 is therefore inhibition of

LOC149103 (Accession XM_086434). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149103. LOC150577 (Accession XM_097918) is another VGAM2052 host target gene. LOC150577 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150577 BINDING SITE, designated SEQ ID:41226, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71861] Another function of VGAM2052 is therefore inhibition of LOC150577 (Accession XM_097918). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150577. LOC158572 (Accession XM_088608) is another VGAM2052 host target gene. LOC158572 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158572, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC158572 BINDING SITE, designated SEQ ID:39872, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71862] Another function of VGAM2052 is therefore inhibition of LOC158572 (Accession XM_088608). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158572. LOC199704 (Accession XM_113994) is another VGAM2052 host target gene. LOC199704 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC199704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199704 BINDING SITE, designated SEQ ID:42603, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71863] Another function of VGAM2052 is therefore inhibition of LOC199704 (Accession XM_113994). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199704. LOC220573 (Accession XM_045569) is an-

other VGAM2052 host target gene. LOC220573 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220573 BINDING SITE, designated SEQ ID:34483, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71864] Another function of VGAM2052 is therefore inhibition of LOC220573 (Accession XM_045569). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220573. LOC255098 (Accession XM_170912) is another VGAM2052 host target gene. LOC255098 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255098, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255098 BINDING SITE, designated SEQ ID:45690, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71865] Another function of VGAM2052 is therefore inhibition of LOC255098 (Accession XM_170912). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255098. LOC257000 (Accession XM_172999) is another VGAM2052 host target gene. LOC257000 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257000, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257000 BINDING SITE, designated SEQ ID:46272, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71866] Another function of VGAM2052 is therefore inhibition of LOC257000 (Accession XM_172999). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257000. LOC257465 (Accession XM_088384) is another VGAM2052 host target gene. LOC257465 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257465, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257465 BINDING SITE, designated SEQ ID:39665, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71867] Another function of VGAM2052 is therefore inhibition of LOC257465 (Accession XM_088384). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257465. LOC57105 (Accession NM_020377) is another VGAM2052 host target gene. LOC57105 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC57105, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57105 BINDING SITE, designated SEQ ID:21636, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71868] Another function of VGAM2052 is therefore inhibition of LOC57105 (Accession NM_020377). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC57105. LOC90333 (Accession XM_030958) is another VGAM2052 host target gene. LOC90333 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90333 BINDING SITE, designated SEQ ID:31222, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71869] Another function of VGAM2052 is therefore inhibition of LOC90333 (Accession XM_030958). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90333. LOC90494 (Accession XM_032161) is another VGAM2052 host target gene. LOC90494 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90494, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90494 BINDING SITE, designated SEQ ID:31576, to the nucleotide sequence of VGAM2052 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4763.

[71870] Another function of VGAM2052 is therefore inhibition of LOC90494 (Accession XM_032161). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90494. LOC92299 (Accession XM_044075) is another VGAM2052 host target gene. LOC92299 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92299, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92299 BINDING SITE, designated SEQ ID:34132, to the nucleotide sequence of VGAM2052 RNA, herein designated VGAM RNA, also designated SEQ ID:4763.

[71871] Another function of VGAM2052 is therefore inhibition of LOC92299 (Accession XM_044075). Accordingly, utilities of VGAM2052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92299. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2053 (VGAM2053) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71872] VGAM2053 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2053 was detected is described hereinabove with reference to Figs. 1-8.

[71873] VGAM2053 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ovine Adenovirus A. VGAM2053 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71874] VGAM2053 gene encodes a VGAM2053 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2053 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2053 precursor RNA is designated SEQ ID:2039, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2039 is located at position 25948 relative to the genome of Ovine Adenovirus A.

[71875] VGAM2053 precursor RNA folds onto itself, forming

VGAM2053 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71876] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2053 folded precursor RNA into VGAM2053 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM2053 RNA is designated SEQ ID:4764, and is provided hereinbelow with reference to the sequence listing part.

[71877] VGAM2053 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2053 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2053 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71878] VGAM2053 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2053 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2053 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2053 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2053 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71879] The complementary binding of VGAM2053 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2053 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2053 host target RNA into VGAM2053 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71880] It is appreciated that VGAM2053 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2053 host target genes. The mRNA of each one of this plurality of VGAM2053 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2053 RNA, herein designated VGAM RNA, and which when bound by VGAM2053 RNA causes inhibition of translation of respective one or more VGAM2053 host target proteins.

[71881] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2053 gene, herein designated VGAM GENE, on one or more VGAM2053 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71882] It is yet further appreciated that a function of VGAM2053 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2053 include diagnosis, prevention and treatment of viral infection by Ovine Adenovirus A. Specific functions, and accordingly utilities, of VGAM2053 correlate with, and may be deduced from, the identity of the host target genes which VGAM2053 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[71883] Nucleotide sequences of the VGAM2053 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2053 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2053 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2053 are further described hereinbelow with reference to Table 1.

[71884] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2053 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2053 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71885] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2053 gene, herein designated VGAM is inhibition of expression of VGAM2053 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2053 correlate with, and may be deduced from, the identity of the target genes which VGAM2053 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[71886] Fatty Acid Binding Protein 2, Intestinal (FABP2, Accession NM_000134) is a VGAM2053 host target gene. FABP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FABP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FABP2 BINDING SITE, designated SEQ ID:5620, to the nucleotide sequence of VGAM2053 RNA, herein designated VGAM RNA, also designated SEQ ID:4764.

[71887] A function of VGAM2053 is therefore inhibition of Fatty Acid Binding Protein 2, Intestinal (FABP2, Accession NM_000134), a gene which may have a role in dietary fat uptake or processing. Accordingly, utilities of VGAM2053 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FABP2. The function of FABP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM951.High-mobility Group Box 3 (HMGB3, Accession NM_005342) is another VGAM2053 host target gene. HMGB3 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by HMGB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGB3 BINDING SITE, designated SEQ ID:11818, to the nucleotide sequence of VGAM2053 RNA, herein designated VGAM RNA, also designated SEQ ID:4764.

[71888] Another function of VGAM2053 is therefore inhibition of High-mobility Group Box 3 (HMGB3, Accession NM_005342), a gene which plays a fundamental role in DNA replication, nucleosome assembly, and transcription. Accordingly, utilities of VGAM2053 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGB3. The function of HMGB3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1272.HN1L (Accession NM_144570) is another VGAM2053 host target gene. HN1L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HN1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of HN1L BINDING SITE, designated SEQ ID:29378, to the nucleotide sequence of VGAM2053 RNA, herein designated VGAM RNA, also designated SEQ ID:4764.

[71889] Another function of VGAM2053 is therefore inhibition of HN1L (Accession NM_144570). Accordingly, utilities of VGAM2053 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HN1L. poly(A) Polymerase Gamma (PAPOLG, Accession NM_022894) is another VGAM2053 host target gene. PAPOLG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PAPOLG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAPOLG BINDING SITE, designated SEQ ID:23153, to the nucleotide sequence of VGAM2053 RNA, herein designated VGAM RNA, also designated SEQ ID:4764.

[71890] Another function of VGAM2053 is therefore inhibition of poly(A) Polymerase Gamma (PAPOLG, Accession NM_022894). Accordingly, utilities of VGAM2053 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with PAPOLG. LOC145790 (Accession XM_085234) is another VGAM2053 host target gene. LOC145790 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145790, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145790 BINDING SITE, designated SEQ ID:37977, to the nucleotide sequence of VGAM2053 RNA, herein designated VGAM RNA, also designated SEQ ID:4764.

[71891] Another function of VGAM2053 is therefore inhibition of LOC145790 (Accession XM_085234). Accordingly, utilities of VGAM2053 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145790. LOC219654 (Accession XM_166095) is another VGAM2053 host target gene. LOC219654 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219654, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219654 BINDING SITE, designated SEQ ID:43876, to

the nucleotide sequence of VGAM2053 RNA, herein designated VGAM RNA, also designated SEQ ID:4764.

[71892] Another function of VGAM2053 is therefore inhibition of LOC219654 (Accession XM_166095). Accordingly, utilities of VGAM2053 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219654. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2054 (VGAM2054) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71893] VGAM2054 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2054 was detected is described hereinabove with reference to Figs. 1-8.

[71894] VGAM2054 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2054 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71895] VGAM2054 gene encodes a VGAM2054 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2054 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2054 precursor RNA is designated SEQ ID:2040, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2040 is located at position 2713 relative to the genome of Ectromelia Virus.

[71896] VGAM2054 precursor RNA folds onto itself, forming VGAM2054 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71897] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2054 folded precursor RNA into VGAM2054 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2054 RNA is designated SEQ ID:4765, and is provided hereinbelow with reference to the sequence listing part.

[71898] VGAM2054 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2054 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2054 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71899] VGAM2054 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2054 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2054 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2054 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2054 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71900] The complementary binding of VGAM2054 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2054 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2054 host target RNA into VGAM2054 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71901] It is appreciated that VGAM2054 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2054 host target genes. The mRNA of each one of this plurality of VGAM2054 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2054 RNA, herein designated VGAM RNA, and which when bound by VGAM2054 RNA causes inhibition of translation of respective one or more VGAM2054 host target proteins.

[71902] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2054 gene, herein designated VGAM GENE, on one or more VGAM2054 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71903] It is yet further appreciated that a function of VGAM2054 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2054 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2054 correlate with, and may be deduced from, the identity of the host target genes which VGAM2054 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71904] Nucleotide sequences of the VGAM2054 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2054 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2054 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2054 are further described hereinbelow with reference to Table 1.

[71905] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2054 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2054 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71906] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2054 gene, herein designated VGAM is inhibition of expression of VGAM2054 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2054 correlate with, and may be deduced from, the identity of the target genes which VGAM2054 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71907] Cyclin-dependent Kinase Inhibitor 2C (p18, inhibits CDK4) (CDKN2C, Accession NM_001262) is a VGAM2054 host target gene. CDKN2C BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CDKN2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKN2C BINDING SITE, designated SEQ ID:6927, to the nucleotide sequence of VGAM2054 RNA, herein designated VGAM RNA, also designated SEQ ID:4765.

[71908] A function of VGAM2054 is therefore inhibition of Cyclin-

dependent Kinase Inhibitor 2C (p18, inhibits CDK4) (CDKN2C, Accession NM_001262), a gene which associate with cyclin-CDK complexes or CDKs alone and inhibit their activity. Accordingly, utilities of VGAM2054 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKN2C. The function of CDKN2C has been established by previous studies. Cyclin-dependent kinase inhibitors (CKIs) are a group of low molecular weight proteins that associate with cyclin-CDK complexes or CDKs alone and inhibit their activity. Members of the INK4 family of CKIs specifically bind and inhibit CDK4 (OMIM Ref. No. 123829) and CDK6 (OMIM Ref. No. 603368), thereby preventing cyclin D-dependent phosphorylation of RB1 (OMIM Ref. No. 180200). See INK4D (OMIM Ref. No. 600927). By using a yeast 2-hybrid screen to search for CDK6-interacting proteins, Guan et al. (1994) isolated a partial cDNA encoding a protein that they designated p18 based on its molecular mass of 18 kD. They used the partial cDNA to screen a HeLa cell library and recovered additional cDNAs corresponding to the entire p18 coding region. Sequence analysis revealed that the predicted 168-amino acid p18 protein shares 38% and 42% sequence identity with p16/INK4A (OMIM Ref.

No. 600160) and p14/INK4B (OMIM Ref. No. 600431), respectively. Like p14 and p16, p18 contains an ankyrin repeat domain. Both in vivo and in vitro, p18 interacted strongly with CDK6 and weakly with CDK4, but not with the other CDKs tested. Recombinant p18 inhibited the kinase activity of cyclin D-CDK6 in vitro. Ectopic expression of either p16 or p18 suppressed the growth of human cells in a manner that appears to correlate with the presence of a wildtype RB1 function. Using Northern blot analysis, Guan et al. (1994) found that p18 is expressed as multiple transcripts in various human tissues, with the strongest expression in skeletal muscle. Blais et al. (1998) determined that the p18, or INK4C, gene contains 3 exons and spans more than 7.5 kb. Lapointe et al. (1996) identified a single amino acid substitution (ala72 to pro; A72P) in BT-20 human breast cancer cells that abrogated the ability of p18 to interact with CDK6 and to suppress cell growth. These authors suggested that p18 inactivation by point mutations may contribute to deregulated growth control in certain cell lines and/or tumors. Blais et al. (1998) found this p18 variant in 3 of 35 breast tumors examined, and suggested that it may be a polymorphism.

[71909] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[71910] Blais, A.; Labrie, Y.; Pouliot, F.; Lachance, Y.; Labrie, C. : Structure of the gene encoding the human cyclin-dependent kinase inhibitor p18 and mutational analysis in breast cancer. Biochem. Biophys. Res. Commun. 247: 146-153, 1998. ; and

[71911] Lapointe, J.; Lachance, Y.; Labrie, Y.; Labrie, C. : A p18 mutant defective in CDK6 binding in human breast cancer cells. Cancer Res. 56: 4586-4589, 1996.

[71912] Further studies establishing the function and utilities of CDKN2C are found in John Hopkins OMIM database record ID 603369, and in sited publications numbered 851 and 8511 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.DKFZp761N0624 (Accession NM_032295) is another VGAM2054 host target gene. DKFZp761N0624 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp761N0624, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761N0624 BINDING SITE, designated

SEQ ID:26071, to the nucleotide sequence of VGAM2054 RNA, herein designated VGAM RNA, also designated SEQ ID:4765.

[71913] Another function of VGAM2054 is therefore inhibition of DKFZp761N0624 (Accession NM_032295). Accordingly, utilities of VGAM2054 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761N0624. Nuclear Receptor Subfamily 4, Group A, Member 3 (NR4A3, Accession NM_006981) is another VGAM2054 host target gene. NR4A3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NR4A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR4A3 BINDING SITE, designated SEQ ID:13843, to the nucleotide sequence of VGAM2054 RNA, herein designated VGAM RNA, also designated SEQ ID:4765.

[71914] Another function of VGAM2054 is therefore inhibition of Nuclear Receptor Subfamily 4, Group A, Member 3 (NR4A3, Accession NM_006981). Accordingly, utilities of VGAM2054 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR4A3.

LOC149073 (Accession XM_097577) is another VGAM2054 host target gene. LOC149073 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149073 BINDING SITE, designated SEQ ID:40943, to the nucleotide sequence of VGAM2054 RNA, herein designated VGAM RNA, also designated SEQ ID:4765.

[71915] Another function of VGAM2054 is therefore inhibition of LOC149073 (Accession XM_097577). Accordingly, utilities of VGAM2054 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149073. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2055 (VGAM2055) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71916] VGAM2055 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2055 was detected is described hereinabove with reference to Figs. 1-8.

[71917] VGAM2055 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Peanut Bud Necrosis Virus. VGAM2055 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71918] VGAM2055 gene encodes a VGAM2055 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2055 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2055 precursor RNA is designated SEQ ID:2041, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2041 is located at position 6690 relative to the genome of Peanut Bud Necrosis Virus.

[71919] VGAM2055 precursor RNA folds onto itself, forming VGAM2055 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71920] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2055 folded precursor RNA into VGAM2055 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2055 RNA is designated SEQ ID:4766, and is provided hereinbelow with reference to the sequence listing part.

[71921] VGAM2055 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2055 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2055 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71922] VGAM2055 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2055 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2055 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2055 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2055 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71923] The complementary binding of VGAM2055 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2055 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2055 host target RNA into VGAM2055 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71924] It is appreciated that VGAM2055 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2055 host target genes. The mRNA of each one of this plurality of VGAM2055 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2055 RNA, herein designated VGAM RNA, and which when bound by VGAM2055 RNA causes inhibition of translation of respective one or more VGAM2055 host target proteins.

[71925] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2055 gene, herein designated VGAM GENE, on one or more VGAM2055 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71926] It is yet further appreciated that a function of VGAM2055 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of viral infection by Peanut Bud Necrosis Virus. Specific functions, and accordingly utilities, of VGAM2055 correlate with, and may be deduced from, the identity of the host target genes which VGAM2055 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71927] Nucleotide sequences of the VGAM2055 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2055 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2055 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2055 are further described hereinbelow with reference to Table 1.

[71928] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2055 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2055 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71929] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2055 gene, herein designated VGAM is inhibition of expression of VGAM2055 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2055 correlate with, and may be deduced from, the identity of the target genes which VGAM2055 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71930] BIG1 (Accession NM_006421) is a VGAM2055 host target gene. BIG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BIG1, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIG1 BINDING SITE, designated SEQ ID:13140, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71931] A function of VGAM2055 is therefore inhibition of BIG1 (Accession NM_006421), a gene which is a guanine nucleotide-exchange protein, has a role in vesicular transport. Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIG1. The function of BIG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1190.Fukuyama Type Congenital Muscular Dystrophy (fukutin) (FCMD, Accession NM_006731) is another VGAM2055 host target gene. FCMD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FCMD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FCMD BINDING SITE, designated SEQ ID:13578, to the nucleotide sequence of VGAM2055 RNA, herein

designated VGAM RNA, also designated SEQ ID:4766.

[71932] Another function of VGAM2055 is therefore inhibition of Fukuyama Type Congenital Muscular Dystrophy (fukutin) (FCMD, Accession NM_006731). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCMD. FtsJ Homolog 2 (E. coli) (FTSJ2, Accession NM_013393) is another VGAM2055 host target gene. FTSJ2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FTSJ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FTSJ2 BINDING SITE, designated SEQ ID:15045, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71933] Another function of VGAM2055 is therefore inhibition of FtsJ Homolog 2 (E. coli) (FTSJ2, Accession NM_013393). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FTSJ2. Prostatic Binding Protein (PBP, Accession NM_002567) is another VGAM2055 host target gene. PBP BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by PBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PBP BINDING SITE, designated SEQ ID:8417, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71934] Another function of VGAM2055 is therefore inhibition of Prostatic Binding Protein (PBP, Accession NM_002567), a gene which regulates the activity of the Raf/MEK/ERK module. Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PBP. The function of PBP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1332.Serine/threonine Kinase 10 (STK10, Accession NM_005990) is another VGAM2055 host target gene. STK10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STK10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of STK10 BINDING SITE, designated SEQ ID:12615, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71935] Another function of VGAM2055 is therefore inhibition of Serine/threonine Kinase 10 (STK10, Accession NM_005990), a gene which can act on substrates such as myelin basic protein and histone iia on serine and threonine residues. Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK10. The function of STK10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1958.Rho GTPase Activating Protein 5 (ARHGAP5, Accession XM_085082) is another VGAM2055 host target gene. ARHGAP5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ARHGAP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP5 BINDING SITE, designated SEQ ID:37824, to the nucleotide sequence of VGAM2055

RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71936] Another function of VGAM2055 is therefore inhibition of Rho GTPase Activating Protein 5 (ARHGAP5, Accession XM_085082). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP5. Chromosome 1 Open Reading Frame 22 (C1orf22, Accession NM_025191) is another VGAM2055 host target gene. C1orf22 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf22 BINDING SITE, designated SEQ ID:24842, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71937] Another function of VGAM2055 is therefore inhibition of Chromosome 1 Open Reading Frame 22 (C1orf22, Accession NM_025191). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf22. Chromobox Homolog 6 (CBX6, Accession NM_014292) is another

VGAM2055 host target gene. CBX6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CBX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBX6 BINDING SITE, designated SEQ ID:15580, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71938] Another function of VGAM2055 is therefore inhibition of Chromobox Homolog 6 (CBX6, Accession NM_014292). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBX6. DKFZP434A043 (Accession NM_015396) is another VGAM2055 host target gene. DKFZP434A043 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434A043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434A043 BINDING SITE, designated SEQ ID:17704, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4766.

[71939] Another function of VGAM2055 is therefore inhibition of DKFZP434A043 (Accession NM_015396). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434A043. DKFZP434C212 (Accession XM_044196) is another VGAM2055 host target gene. DKFZP434C212 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434C212, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C212 BINDING SITE, designated SEQ ID:34172, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71940] Another function of VGAM2055 is therefore inhibition of DKFZP434C212 (Accession XM_044196). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C212. DKFZP434J037 (Accession NM_030952) is another VGAM2055 host target gene. DKFZP434J037 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by DKFZP434J037, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434J037 BINDING SITE, designated SEQ ID:25221, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71941] Another function of VGAM2055 is therefore inhibition of DKFZP434J037 (Accession NM_030952). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434J037. FLJ23129 (Accession NM_024763) is another VGAM2055 host target gene. FLJ23129 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23129, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23129 BINDING SITE, designated SEQ ID:24122, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71942] Another function of VGAM2055 is therefore inhibition of

FLJ23129 (Accession NM_024763). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23129. HEMK (Accession NM_016173) is another VGAM2055 host target gene. HEMK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HEMK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEMK BINDING SITE, designated SEQ ID:18275, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71943] Another function of VGAM2055 is therefore inhibition of HEMK (Accession NM_016173). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEMK. KIAA0781 (Accession XM_041314) is another VGAM2055 host target gene. KIAA0781 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0781, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0781 BINDING SITE, designated SEQ ID:33500, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71944] Another function of VGAM2055 is therefore inhibition of KIAA0781 (Accession XM_041314). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0781. KIAA1034 (Accession XM_031223) is another VGAM2055 host target gene. KIAA1034 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1034 BINDING SITE, designated SEQ ID:31313, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71945] Another function of VGAM2055 is therefore inhibition of KIAA1034 (Accession XM_031223). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1034. KIAA1508 (Accession XM_030209) is another

VGAM2055 host target gene. KIAA1508 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1508 BINDING SITE, designated SEQ ID:30997, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71946] Another function of VGAM2055 is therefore inhibition of KIAA1508 (Accession XM_030209). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1508. KIAA1804 (Accession XM_045864) is another VGAM2055 host target gene. KIAA1804 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1804, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1804 BINDING SITE, designated SEQ ID:34589, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71947] Another function of VGAM2055 is therefore inhibition of KIAA1804 (Accession XM_045864). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1804. Ornithine Decarboxylase Antizyme 3 (OAZ3, Accession NM_016178) is another VGAM2055 host target gene. OAZ3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by OAZ3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OAZ3 BINDING SITE, designated SEQ ID:18281, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71948] Another function of VGAM2055 is therefore inhibition of Ornithine Decarboxylase Antizyme 3 (OAZ3, Accession NM_016178). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAZ3. PI4KII (Accession NM_018425) is another VGAM2055 host target gene. PI4KII BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PI4KII, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PI4KII BINDING SITE, designated SEQ ID:20485, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71949] Another function of VGAM2055 is therefore inhibition of PI4KII (Accession NM_018425). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PI4KII. Rho-related BTB Domain Containing 1 (RHOBTB1, Accession XM_166144) is another VGAM2055 host target gene. RHOBTB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RHOBTB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHOBTB1 BINDING SITE, designated SEQ ID:43953, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71950] Another function of VGAM2055 is therefore inhibition of Rho-related BTB Domain Containing 1 (RHOBTB1, Accession XM_166144). Accordingly, utilities of VGAM2055 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with RHOBTB1. VEZATIN (Accession NM_017599) is another VGAM2055 host target gene. VEZATIN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VEZATIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VEZATIN BINDING SITE, designated SEQ ID:19071, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71951] Another function of VGAM2055 is therefore inhibition of VEZATIN (Accession NM_017599). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VEZATIN. ZFP106 (Accession NM_022473) is another VGAM2055 host target gene. ZFP106 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZFP106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP106 BIND-

ING SITE, designated SEQ ID:22836, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71952] Another function of VGAM2055 is therefore inhibition of ZFP106 (Accession NM_022473). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP106. Zinc Finger Protein 363 (ZNF363, Accession XM_055989) is another VGAM2055 host target gene. ZNF363 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF363, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF363 BINDING SITE, designated SEQ ID:36357, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71953] Another function of VGAM2055 is therefore inhibition of Zinc Finger Protein 363 (ZNF363, Accession XM_055989). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF363. LOC149821 (Accession

XM_097751) is another VGAM2055 host target gene. LOC149821 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149821, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149821 BINDING SITE, designated SEQ ID:41110, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71954] Another function of VGAM2055 is therefore inhibition of LOC149821 (Accession XM_097751). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149821. LOC150271 (Accession XM_097859) is another VGAM2055 host target gene. LOC150271 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150271 BINDING SITE, designated SEQ ID:41176, to the nucleotide sequence of VGAM2055 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4766.

[71955] Another function of VGAM2055 is therefore inhibition of LOC150271 (Accession XM_097859). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150271. LOC150445 (Accession XM_086916) is another VGAM2055 host target gene. LOC150445 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150445 BINDING SITE, designated SEQ ID:38972, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71956] Another function of VGAM2055 is therefore inhibition of LOC150445 (Accession XM_086916). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150445. LOC90736 (Accession XM_033811) is another VGAM2055 host target gene. LOC90736 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90736, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90736 BINDING SITE, designated SEQ ID:31958, to the nucleotide sequence of VGAM2055 RNA, herein designated VGAM RNA, also designated SEQ ID:4766.

[71957] Another function of VGAM2055 is therefore inhibition of LOC90736 (Accession XM_033811). Accordingly, utilities of VGAM2055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90736. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2056 (VGAM2056) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71958] VGAM2056 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2056 was detected is described hereinabove with reference to Figs. 1-8.

[71959] VGAM2056 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Peanut Bud Necrosis

Virus. VGAM2056 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71960] VGAM2056 gene encodes a VGAM2056 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2056 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2056 precursor RNA is designated SEQ ID:2042, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2042 is located at position 5281 relative to the genome of Peanut Bud Necrosis Virus.

[71961] VGAM2056 precursor RNA folds onto itself, forming VGAM2056 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71962] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2056 folded precursor RNA into VGAM2056 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2056 RNA is designated SEQ ID:4767, and is provided hereinbelow with reference to the sequence listing part.

[71963] VGAM2056 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2056 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2056 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71964] VGAM2056 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2056 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2056 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2056 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2056 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71965] The complementary binding of VGAM2056 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2056 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2056 host target RNA into VGAM2056 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71966] It is appreciated that VGAM2056 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2056 host target genes. The mRNA of each one of this plurality of VGAM2056 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2056 RNA, herein designated VGAM RNA, and which when bound by VGAM2056 RNA causes inhibition of translation of respective one or more VGAM2056 host target proteins.

[71967] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2056 gene, herein designated VGAM GENE, on one or more VGAM2056 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71968] It is yet further appreciated that a function of VGAM2056 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2056 include diagnosis, prevention and treatment of viral infection by Peanut Bud Necrosis Virus. Specific functions, and accordingly utilities, of VGAM2056 correlate with, and may be deduced from, the identity of the host target genes which VGAM2056 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71969] Nucleotide sequences of the VGAM2056 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2056 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2056 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2056 are further described hereinbelow with reference to Table 1.

[71970] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2056 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2056 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71971] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2056 gene, herein designated VGAM is inhibition of expression of VGAM2056 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2056 correlate with, and may be deduced from, the identity of the target genes which VGAM2056 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71972] Amyotrophic Lateral Sclerosis 2 (juvenile) (ALS2, Accession NM_020919) is a VGAM2056 host target gene. ALS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ALS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALS2 BINDING SITE, designated SEQ ID:21930, to the nu-

cleotide sequence of VGAM2056 RNA, herein designated VGAM RNA, also designated SEQ ID:4767.

[71973] A function of VGAM2056 is therefore inhibition of Amyotrophic Lateral Sclerosis 2 (juvenile) (ALS2, Accession NM_020919). Accordingly, utilities of VGAM2056 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALS2. UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 2 (B3GALT2, Accession NM_003783) is another VGAM2056 host target gene. B3GALT2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by B3GALT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GALT2 BINDING SITE, designated SEQ ID:9873, to the nucleotide sequence of VGAM2056 RNA, herein designated VGAM RNA, also designated SEQ ID:4767.

[71974] Another function of VGAM2056 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 2 (B3GALT2, Accession NM_003783). Accordingly, utilities of VGAM2056 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with B3GALT2. Nuclear RNA Export Factor 2 (NXF2, Accession NM_017809) is another VGAM2056 host target gene. NXF2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NXF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXF2 BINDING SITE, designated SEQ ID:19456, to the nucleotide sequence of VGAM2056 RNA, herein designated VGAM RNA, also designated SEQ ID:4767.

[71975] Another function of VGAM2056 is therefore inhibition of Nuclear RNA Export Factor 2 (NXF2, Accession NM_017809), a gene which is involved in the export of mrna from the nucleus to the cytoplasm. Accordingly, utilities of VGAM2056 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXF2. The function of NXF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM595.DKFZP434C1715 (Accession XM_098421) is another VGAM2056 host target gene. DKFZP434C1715 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

DKFZP434C1715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C1715 BINDING SITE, designated SEQ ID:41678, to the nucleotide sequence of VGAM2056 RNA, herein designated VGAM RNA, also designated SEQ ID:4767.

[71976] Another function of VGAM2056 is therefore inhibition of DKFZP434C1715 (Accession XM_098421). Accordingly, utilities of VGAM2056 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C1715. KIAA1831 (Accession XM_033366) is another VGAM2056 host target gene. KIAA1831 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1831, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1831 BINDING SITE, designated SEQ ID:31900, to the nucleotide sequence of VGAM2056 RNA, herein designated VGAM RNA, also designated SEQ ID:4767.

[71977] Another function of VGAM2056 is therefore inhibition of KIAA1831 (Accession XM_033366). Accordingly, utilities

of VGAM2056 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1831. MGC16824 (Accession NM_020314) is another VGAM2056 host target gene. MGC16824 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC16824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16824 BINDING SITE, designated SEQ ID:21571, to the nucleotide sequence of VGAM2056 RNA, herein designated VGAM RNA, also designated SEQ ID:4767.

[71978] Another function of VGAM2056 is therefore inhibition of MGC16824 (Accession NM_020314). Accordingly, utilities of VGAM2056 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16824. MGC4562 (Accession NM_133375) is another VGAM2056 host target gene. MGC4562 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC4562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4562

BINDING SITE, designated SEQ ID:28498, to the nucleotide sequence of VGAM2056 RNA, herein designated VGAM RNA, also designated SEQ ID:4767.

[71979] Another function of VGAM2056 is therefore inhibition of MGC4562 (Accession NM_133375). Accordingly, utilities of VGAM2056 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4562. RAB10, Member RAS Oncogene Family (RAB10, Accession XM_097979) is another VGAM2056 host target gene. RAB10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB10 BINDING SITE, designated SEQ ID:41284, to the nucleotide sequence of VGAM2056 RNA, herein designated VGAM RNA, also designated SEQ ID:4767.

[71980] Another function of VGAM2056 is therefore inhibition of RAB10, Member RAS Oncogene Family (RAB10, Accession XM_097979). Accordingly, utilities of VGAM2056 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB10. LOC221362

(Accession XM_168093) is another VGAM2056 host target gene. LOC221362 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221362, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221362 BINDING SITE, designated SEQ ID:45024, to the nucleotide sequence of VGAM2056 RNA, herein designated VGAM RNA, also designated SEQ ID:4767.

[71981] Another function of VGAM2056 is therefore inhibition of LOC221362 (Accession XM_168093). Accordingly, utilities of VGAM2056 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221362. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2057 (VGAM2057) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71982] VGAM2057 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2057 was detected is described hereinabove with reference to Figs. 1-8.

[71983] VGAM2057 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2057 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[71984] VGAM2057 gene encodes a VGAM2057 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2057 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2057 precursor RNA is designated SEQ ID:2043, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2043 is located at position 3968 relative to the genome of Ectromelia Virus.

[71985] VGAM2057 precursor RNA folds onto itself, forming VGAM2057 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[71986] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2057 folded precursor RNA into VGAM2057 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 69%) nucleotide sequence of VGAM2057 RNA is designated SEQ ID:4768, and is provided hereinbelow with reference to the sequence listing part.

[71987] VGAM2057 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2057 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2057 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[71988] VGAM2057 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2057 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2057 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2057 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2057 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[71989] The complementary binding of VGAM2057 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2057 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2057 host target RNA into VGAM2057 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[71990] It is appreciated that VGAM2057 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2057 host target genes. The mRNA of each one of this plurality of VGAM2057 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2057 RNA, herein designated VGAM RNA, and which when bound by VGAM2057 RNA causes inhibition of translation of respective one or more VGAM2057 host target proteins.

[71991] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2057 gene, herein designated VGAM GENE, on one or more VGAM2057 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[71992] It is yet further appreciated that a function of VGAM2057 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2057 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2057 correlate with, and may be deduced from, the identity of the host target genes which VGAM2057 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[71993] Nucleotide sequences of the VGAM2057 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2057 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2057 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2057 are further described hereinbelow with reference to Table 1.

[71994] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2057 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2057 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[71995] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2057 gene, herein designated VGAM is inhibition of expression of VGAM2057 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2057 correlate with, and may be deduced from, the identity of the target genes which VGAM2057 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[71996] FYVE and Coiled-coil Domain Containing 1 (FYCO1, Accession NM_024513) is a VGAM2057 host target gene. FYCO1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

FYCO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FYCO1 BINDING SITE, designated SEQ ID:23712, to the nucleotide sequence of VGAM2057 RNA, herein designated VGAM RNA, also designated SEQ ID:4768.

[71997] A function of VGAM2057 is therefore inhibition of FYVE and Coiled-coil Domain Containing 1 (FYCO1, Accession NM_024513). Accordingly, utilities of VGAM2057 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FYCO1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2058 (VGAM2058) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[71998] VGAM2058 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2058 was detected is described hereinabove with reference to Figs. 1-8.

[71999] VGAM2058 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Peanut Bud Necrosis Virus. VGAM2058 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72000] VGAM2058 gene encodes a VGAM2058 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2058 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2058 precursor RNA is designated SEQ ID:2044, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2044 is located at position 4967 relative to the genome of Peanut Bud Necrosis Virus.

[72001] VGAM2058 precursor RNA folds onto itself, forming VGAM2058 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72002] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2058 folded precursor RNA into VGAM2058 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM2058 RNA is designated SEQ ID:4769, and is provided hereinbelow with reference to the sequence listing part.

[72003] VGAM2058 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2058 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2058 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72004] VGAM2058 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2058 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2058 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2058 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2058 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72005] The complementary binding of VGAM2058 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2058 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2058

host target RNA into VGAM2058 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72006] It is appreciated that VGAM2058 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2058 host target genes. The mRNA of each one of this plurality of VGAM2058 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2058 RNA, herein designated VGAM RNA, and which when bound by VGAM2058 RNA causes inhibition of translation of respective one or more VGAM2058 host target proteins.

[72007] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2058 gene, herein designated VGAM GENE, on one or more VGAM2058 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72008] It is yet further appreciated that a function of VGAM2058 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of viral infection by Peanut Bud Necrosis Virus. Specific functions, and accordingly utilities, of VGAM2058 correlate with, and may be deduced from, the identity of the host target genes which VGAM2058 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72009] Nucleotide sequences of the VGAM2058 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2058 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2058 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2058 are further

described hereinbelow with reference to Table 1.

[72010] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2058 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2058 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72011] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2058 gene, herein designated VGAM is inhibition of expression of VGAM2058 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2058 correlate with, and may be deduced from, the identity of the target genes which VGAM2058 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72012] Adenosine Deaminase, RNA-specific (ADAR, Accession NM_001111) is a VGAM2058 host target gene. ADAR BINDING SITE1 through ADAR BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADAR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of ADAR BINDING SITE1 through ADAR BINDING SITE3, designated SEQ ID:6770, SEQ ID:17956 and SEQ ID:17963 respectively, to the nucleotide sequence of VGAM2058 RNA, herein designated VGAM RNA, also designated SEQ ID:4769.

[72013] A function of VGAM2058 is therefore inhibition of Adenosine Deaminase, RNA-specific (ADAR, Accession NM_001111), a gene which converts adenosine to inosine in double-stranded RNA. Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAR. The function of ADAR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM323.Collagen, Type IV, Alpha 3 (Goodpasture antigen) (COL4A3, Accession NM_031363) is another VGAM2058 host target gene. COL4A3 BINDING SITE1 through COL4A3 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL4A3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL4A3 BINDING SITE1 through COL4A3

BINDING SITE3, designated SEQ ID:25353, SEQ ID:5546 and SEQ ID:35916 respectively, to the nucleotide sequence of VGAM2058 RNA, herein designated VGAM RNA, also designated SEQ ID:4769.

[72014] Another function of VGAM2058 is therefore inhibition of Collagen, Type IV, Alpha 3 (Goodpasture antigen) (COL4A3, Accession NM_031363). Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A3. Nuclear Receptor Subfamily 1, Group I, Member 2 (NR1I2, Accession NM_022002) is another VGAM2058 host target gene. NR1I2 BINDING SITE1 and NR1I2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NR1I2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR1I2 BINDING SITE1 and NR1I2 BINDING SITE2, designated SEQ ID:22545 and SEQ ID:9972 respectively, to the nucleotide sequence of VGAM2058 RNA, herein designated VGAM RNA, also designated SEQ ID:4769.

[72015] Another function of VGAM2058 is therefore inhibition of Nuclear Receptor Subfamily 1, Group I, Member 2 (NR1I2,

Accession NM_022002), a gene which binds to a response element in the cyp3a4 gene promoter and activates its expression in response to a wide variety of endobiotics and xenobiotics. Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR1I2. The function of NR1I2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM336.Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 6 (SLC9A6, Accession NM_006359) is another VGAM2058 host target gene. SLC9A6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC9A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC9A6 BINDING SITE, designated SEQ ID:13053, to the nucleotide sequence of VGAM2058 RNA, herein designated VGAM RNA, also designated SEQ ID:4769.

[72016] Another function of VGAM2058 is therefore inhibition of Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 6 (SLC9A6, Accession NM_006359), a gene which

is involved electroneutral exchange of protons for na+ and k+ across the mitochondrial inner membrane. Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A6. The function of SLC9A6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM493.Tumor Necrosis Factor (ligand) Superfamily, Member 4 (tax-transcriptionally activated glycoprotein 1, 34kDa) (TNFSF4, Accession NM_003326) is another VGAM2058 host target gene. TNFSF4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFSF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF4 BINDING SITE, designated SEQ ID:9334, to the nucleotide sequence of VGAM2058 RNA, herein designated VGAM RNA, also designated SEQ ID:4769.

[72017] Another function of VGAM2058 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 4 (tax-transcriptionally activated glycoprotein 1, 34kDa)

(TNFSF4, Accession NM_003326), a gene which co-stimulates t cell proliferation and cytokine production. Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF4. The function of TNFSF4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM463.Agmatine Ureohydrolase (agmatinase) (AGMAT, Accession NM_024758) is another VGAM2058 host target gene. AGMAT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AGMAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGMAT BINDING SITE, designated SEQ ID:24105, to the nucleotide sequence of VGAM2058 RNA, herein designated VGAM RNA, also designated SEQ ID:4769.

[72018] Another function of VGAM2058 is therefore inhibition of Agmatine Ureohydrolase (agmatinase) (AGMAT, Accession NM_024758). Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with AGMAT. ATPase, H+ Transporting, Lysosomal V0 Subunit A Isoform 1 (ATP6V0A1, Accession NM_005177) is another VGAM2058 host target gene. ATP6V0A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP6V0A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP6V0A1 BINDING SITE, designated SEQ ID:11675, to the nucleotide sequence of VGAM2058 RNA, herein designated VGAM RNA, also designated SEQ ID:4769.

[72019] Another function of VGAM2058 is therefore inhibition of ATPase, H+ Transporting, Lysosomal V0 Subunit A Isoform 1 (ATP6V0A1, Accession NM_005177). Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V0A1. Cat Eye Syndrome Chromosome Region, Candidate 6 (CECR6, Accession NM_031890) is another VGAM2058 host target gene. CECR6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CECR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CECR6 BINDING SITE, designated SEQ ID:25638, to the nucleotide sequence of VGAM2058 RNA, herein designated VGAM RNA, also designated SEQ ID:4769.

[72020] Another function of VGAM2058 is therefore inhibition of Cat Eye Syndrome Chromosome Region, Candidate 6 (CECR6, Accession NM_031890). Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR6. Deiodinase, Iodothyronine, Type II (DIO2, Accession NM_013989) is another VGAM2058 host target gene. DIO2 BINDING SITE1 and DIO2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DIO2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIO2 BINDING SITE1 and DIO2 BINDING SITE2, designated SEQ ID:15166 and SEQ ID:6456 respectively, to the nucleotide sequence of VGAM2058 RNA, herein designated VGAM RNA, also designated SEQ ID:4769.

[72021] Another function of VGAM2058 is therefore inhibition of

Deiodinase, Iodothyronine, Type II (DIO2, Accession NM_013989). Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIO2. ERG-1 (Accession NM_022034) is another VGAM2058 host target gene. ERG-1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ERG-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERG-1 BINDING SITE, designated SEQ ID:22556, to the nucleotide sequence of VGAM2058 RNA, herein designated VGAM RNA, also designated SEQ ID:4769.

[72022] Another function of VGAM2058 is therefore inhibition of ERG-1 (Accession NM_022034). Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERG-1. FLJ14437 (Accession NM_032578) is another VGAM2058 host target gene. FLJ14437 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14437 BINDING SITE, designated SEQ ID:26307, to the nucleotide sequence of VGAM2058 RNA, herein designated VGAM RNA, also designated SEQ ID:4769.

[72023] Another function of VGAM2058 is therefore inhibition of FLJ14437 (Accession NM_032578). Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14437. HCAP-G (Accession NM_022346) is another VGAM2058 host target gene. HCAP-G BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HCAP-G, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCAP-G BINDING SITE, designated SEQ ID:22746, to the nucleotide sequence of VGAM2058 RNA, herein designated VGAM RNA, also designated SEQ ID:4769.

[72024] Another function of VGAM2058 is therefore inhibition of HCAP-G (Accession NM_022346). Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCAP-

G. KIAA0205 (Accession NM_014873) is another VGAM2058 host target gene. KIAA0205 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0205 BINDING SITE, designated SEQ ID:17003, to the nucleotide sequence of VGAM2058 RNA, herein designated VGAM RNA, also designated SEQ ID:4769.

[72025] Another function of VGAM2058 is therefore inhibition of KIAA0205 (Accession NM_014873). Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0205. MGC4737 (Accession NM_031466) is another VGAM2058 host target gene. MGC4737 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4737 BINDING SITE, designated SEQ ID:25504, to the nucleotide sequence of VGAM2058 RNA, herein designated VGAM

RNA, also designated SEQ ID:4769.

[72026] Another function of VGAM2058 is therefore inhibition of MGC4737 (Accession NM_031466). Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4737. START Domain Containing 7 (STARD7, Accession NM_139267) is another VGAM2058 host target gene. STARD7 BINDING SITE1 and STARD7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by STARD7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STARD7 BINDING SITE1 and STARD7 BINDING SITE2, designated SEQ ID:29263 and SEQ ID:21361 respectively, to the nucleotide sequence of VGAM2058 RNA, herein designated VGAM RNA, also designated SEQ ID:4769.

[72027] Another function of VGAM2058 is therefore inhibition of START Domain Containing 7 (STARD7, Accession NM_139267). Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STARD7. LOC131368 (Accession XM_067347) is another VGAM2058 host target

gene. LOC131368 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC131368, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131368 BINDING SITE, designated SEQ ID:37354, to the nucleotide sequence of VGAM2058 RNA, herein designated VGAM RNA, also designated SEQ ID:4769.

[72028] Another function of VGAM2058 is therefore inhibition of LOC131368 (Accession XM_067347). Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131368. LOC148930 (Accession XM_086369) is another VGAM2058 host target gene. LOC148930 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148930 BINDING SITE, designated SEQ ID:38617, to the nucleotide sequence of VGAM2058 RNA, herein designated VGAM RNA, also designated SEQ ID:4769.

[72029] Another function of VGAM2058 is therefore inhibition of LOC148930 (Accession XM_086369). Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148930. LOC149506 (Accession XM_097661) is another VGAM2058 host target gene. LOC149506 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149506, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149506 BINDING SITE, designated SEQ ID:41001, to the nucleotide sequence of VGAM2058 RNA, herein designated VGAM RNA, also designated SEQ ID:4769.

[72030] Another function of VGAM2058 is therefore inhibition of LOC149506 (Accession XM_097661). Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149506. LOC158434 (Accession XM_098939) is another VGAM2058 host target gene. LOC158434 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158434, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158434 BINDING SITE, designated SEQ ID:41983, to the nucleotide sequence of VGAM2058 RNA, herein designated VGAM RNA, also designated SEQ ID:4769.

[72031] Another function of VGAM2058 is therefore inhibition of LOC158434 (Accession XM_098939). Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158434. LOC196955 (Accession XM_085210) is another VGAM2058 host target gene. LOC196955 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196955 BINDING SITE, designated SEQ ID:37930, to the nucleotide sequence of VGAM2058 RNA, herein designated VGAM RNA, also designated SEQ ID:4769.

[72032] Another function of VGAM2058 is therefore inhibition of LOC196955 (Accession XM_085210). Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC196955. LOC256789 (Accession XM_173369) is another VGAM2058 host target gene. LOC256789 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256789 BINDING SITE, designated SEQ ID:46538, to the nucleotide sequence of VGAM2058 RNA, herein designated VGAM RNA, also designated SEQ ID:4769.

[72033] Another function of VGAM2058 is therefore inhibition of LOC256789 (Accession XM_173369). Accordingly, utilities of VGAM2058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256789. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2059 (VGAM2059) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72034] VGAM2059 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2059 was detected is described hereinabove with reference to Figs. 1-8.

[72035] VGAM2059 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2059 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72036] VGAM2059 gene encodes a VGAM2059 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2059 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2059 precursor RNA is designated SEQ ID:2045, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2045 is located at position 15250 relative to the genome of Ectromelia Virus.

[72037] VGAM2059 precursor RNA folds onto itself, forming VGAM2059 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72038] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2059 folded precursor RNA into VGAM2059 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2059 RNA is designated SEQ ID:4770, and is provided hereinbelow with reference to the sequence listing part.

[72039] VGAM2059 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2059 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2059 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72040] VGAM2059 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2059 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2059 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2059 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2059 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72041] The complementary binding of VGAM2059 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2059 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2059 host target RNA into VGAM2059 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72042] It is appreciated that VGAM2059 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2059 host target genes. The mRNA of each one of this plurality of VGAM2059 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2059 RNA, herein designated VGAM RNA, and which when bound by VGAM2059 RNA causes inhibition of translation of respective one or more VGAM2059 host target proteins.

[72043] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2059 gene, herein designated VGAM GENE, on one or more VGAM2059 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72044] It is yet further appreciated that a function of VGAM2059 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2059 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2059 correlate with, and may be deduced from, the identity of the host target genes which VGAM2059 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72045] Nucleotide sequences of the VGAM2059 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2059 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2059 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2059 are further described hereinbelow with reference to Table 1.

[72046] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2059 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2059 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72047] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2059 gene, herein designated VGAM is inhibition of expression of VGAM2059 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2059 correlate with, and may be deduced from, the identity of the target genes which VGAM2059 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72048] Deleted In Azoospermia (DAZ, Accession NM_004081) is a VGAM2059 host target gene. DAZ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DAZ, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAZ BINDING SITE, designated SEQ ID:10282, to the nucleotide sequence of VGAM2059 RNA, herein designated VGAM RNA, also designated SEQ ID:4770.

[72049] A function of VGAM2059 is therefore inhibition of Deleted In Azoospermia (DAZ, Accession NM_004081), a gene which may play a role in the germ-cell-specific patterns of RNA splicing and storage. Accordingly, utilities of VGAM2059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAZ. The function of DAZ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.Deleted In Azoospermia-like (DAZL, Accession XM_042839) is another VGAM2059 host target gene. DAZL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DAZL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAZL BINDING SITE, designated SEQ ID:33801,

to the nucleotide sequence of VGAM2059 RNA, herein designated VGAM RNA, also designated SEQ ID:4770.

[72050] Another function of VGAM2059 is therefore inhibition of Deleted In Azoospermia-like (DAZL, Accession XM_042839), a gene which may be essential for gametogenesis. Accordingly, utilities of VGAM2059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAZL. The function of DAZL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.FLJ20330 (Accession NM_018988) is another VGAM2059 host target gene. FLJ20330 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20330, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20330 BINDING SITE, designated SEQ ID:21060, to the nucleotide sequence of VGAM2059 RNA, herein designated VGAM RNA, also designated SEQ ID:4770.

[72051] Another function of VGAM2059 is therefore inhibition of FLJ20330 (Accession NM_018988). Accordingly, utilities of

VGAM2059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20330. KIAA1908 (Accession XM_055834) is another VGAM2059 host target gene. KIAA1908 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1908, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1908 BINDING SITE, designated SEQ ID:36336, to the nucleotide sequence of VGAM2059 RNA, herein designated VGAM RNA, also designated SEQ ID:4770.

[72052] Another function of VGAM2059 is therefore inhibition of KIAA1908 (Accession XM_055834). Accordingly, utilities of VGAM2059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1908. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2060 (VGAM2060) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72053] VGAM2060 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2060 was detected is described hereinabove with reference to Figs. 1-8.

[72054] VGAM2060 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2060 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72055] VGAM2060 gene encodes a VGAM2060 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2060 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2060 precursor RNA is designated SEQ ID:2046, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2046 is located at position 3202 relative to the genome of Ectromelia Virus.

[72056] VGAM2060 precursor RNA folds onto itself, forming VGAM2060 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72057] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2060 folded precursor RNA into VGAM2060 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM2060 RNA is designated SEQ ID:4771, and is provided hereinbelow with reference to the sequence listing part.

[72058] VGAM2060 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2060 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2060 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[72059] VGAM2060 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2060 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2060 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2060 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2060 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72060] The complementary binding of VGAM2060 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2060 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2060 host target RNA into VGAM2060 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72061] It is appreciated that VGAM2060 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2060 host target genes. The mRNA of each one of this plurality of VGAM2060 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2060 RNA, herein designated VGAM RNA, and which when bound by VGAM2060 RNA causes inhibition of translation of respective one or more VGAM2060 host target proteins.

[72062] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2060 gene, herein designated VGAM GENE, on one or more VGAM2060 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72063] It is yet further appreciated that a function of VGAM2060 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2060 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2060 correlate with, and may be deduced from, the identity of the host target genes which VGAM2060 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72064] Nucleotide sequences of the VGAM2060 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2060 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2060 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2060 are further described hereinbelow with reference to Table 1.

[72065] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2060 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2060 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72066] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2060 gene, herein designated VGAM is inhibition of expression of VGAM2060 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2060 correlate with, and may be deduced from, the identity of the target genes which VGAM2060 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72067] Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM_052966) is a VGAM2060 host target gene.

C1orf24 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf24 BINDING SITE, designated SEQ ID:27531, to the nucleotide sequence of VGAM2060 RNA, herein designated VGAM RNA, also designated SEQ ID:4771.

[72068] A function of VGAM2060 is therefore inhibition of Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM_052966). Accordingly, utilities of VGAM2060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf24. FLJ12761 (Accession NM_024545) is another VGAM2060 host target gene. FLJ12761 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12761, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12761 BINDING SITE, designated SEQ ID:23757, to the nucleotide sequence of VGAM2060 RNA, herein designated VGAM RNA, also designated SEQ

ID:4771.

[72069] Another function of VGAM2060 is therefore inhibition of FLJ12761 (Accession NM_024545). Accordingly, utilities of VGAM2060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12761. KIAA0574 (Accession XM_045076) is another VGAM2060 host target gene. KIAA0574 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0574, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0574 BINDING SITE, designated SEQ ID:34343, to the nucleotide sequence of VGAM2060 RNA, herein designated VGAM RNA, also designated SEQ ID:4771.

[72070] Another function of VGAM2060 is therefore inhibition of KIAA0574 (Accession XM_045076). Accordingly, utilities of VGAM2060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0574. KIAA1766 (Accession XM_049218) is another VGAM2060 host target gene. KIAA1766 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1766, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1766 BINDING SITE, designated SEQ ID:35352, to the nucleotide sequence of VGAM2060 RNA, herein designated VGAM RNA, also designated SEQ ID:4771.

[72071] Another function of VGAM2060 is therefore inhibition of KIAA1766 (Accession XM_049218). Accordingly, utilities of VGAM2060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1766. NIBAN (Accession NM_022083) is another VGAM2060 host target gene. NIBAN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NIBAN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NIBAN BINDING SITE, designated SEQ ID:22628, to the nucleotide sequence of VGAM2060 RNA, herein designated VGAM RNA, also designated SEQ ID:4771.

[72072] Another function of VGAM2060 is therefore inhibition of NIBAN (Accession NM_022083). Accordingly, utilities of VGAM2060 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with NIBAN. LOC90381 (Accession XM_031334) is another VGAM2060 host target gene. LOC90381 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90381, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90381 BINDING SITE, designated SEQ ID:31344, to the nucleotide sequence of VGAM2060 RNA, herein designated VGAM RNA, also designated SEQ ID:4771.

[72073] Another function of VGAM2060 is therefore inhibition of LOC90381 (Accession XM_031334). Accordingly, utilities of VGAM2060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90381. LOC91960 (Accession XM_041872) is another VGAM2060 host target gene. LOC91960 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91960 BINDING SITE, designated SEQ ID:33609, to the

nucleotide sequence of VGAM2060 RNA, herein designated VGAM RNA, also designated SEQ ID:4771.

[72074] Another function of VGAM2060 is therefore inhibition of LOC91960 (Accession XM_041872). Accordingly, utilities of VGAM2060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91960. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2061 (VGAM2061) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72075] VGAM2061 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2061 was detected is described hereinabove with reference to Figs. 1-8.

[72076] VGAM2061 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2061 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72077] VGAM2061 gene encodes a VGAM2061 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2061 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2061 precursor RNA is designated SEQ ID:2047, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2047 is located at position 132 relative to the genome of Ectromelia Virus.

[72078] VGAM2061 precursor RNA folds onto itself, forming VGAM2061 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72079] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2061 folded precursor RNA into VGAM2061 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2061 RNA is designated SEQ ID:4772, and is provided hereinbelow with reference to the sequence listing part.

[72080] VGAM2061 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2061 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2061 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72081] VGAM2061 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2061 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2061 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2061 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2061 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72082] The complementary binding of VGAM2061 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2061 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2061 host target RNA into VGAM2061 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72083] It is appreciated that VGAM2061 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2061 host target genes. The mRNA of each one of this plurality of VGAM2061 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2061 RNA, herein designated VGAM RNA, and which when bound by VGAM2061 RNA causes inhibition of translation of respective one or more VGAM2061 host target proteins.

[72084] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2061 gene, herein designated VGAM GENE, on one or more VGAM2061 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72085] It is yet further appreciated that a function of VGAM2061 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2061 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2061 correlate with, and may be deduced from, the identity of the host target genes which VGAM2061 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72086] Nucleotide sequences of the VGAM2061 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2061 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2061 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2061 are further described hereinbelow with reference to Table 1.

[72087] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2061 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2061 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72088] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2061 gene, herein designated VGAM is inhibition of expression of VGAM2061 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2061 correlate with, and may be deduced from, the identity of the target genes which VGAM2061 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72089] ATP-binding Cassette, Sub-family D (ALD), Member 2 (ABCD2, Accession NM_005164) is a VGAM2061 host target gene. ABCD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABCD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCD2 BINDING SITE, designated SEQ ID:11660, to the nucleotide sequence of VGAM2061 RNA, herein designated VGAM RNA, also designated SEQ ID:4772.

[72090] A function of VGAM2061 is therefore inhibition of ATP-

binding Cassette, Sub-family D (ALD), Member 2 (ABCD2, Accession NM_005164), a gene which probable transporter. Accordingly, utilities of VGAM2061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCD2. The function of ABCD2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM229.DNA2 DNA Replication Helicase 2-like (yeast) (DNA2L, Accession XM_166103) is another VGAM2061 host target gene. DNA2L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DNA2L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNA2L BINDING SITE, designated SEQ ID:43881, to the nucleotide sequence of VGAM2061 RNA, herein designated VGAM RNA, also designated SEQ ID:4772.

[72091] Another function of VGAM2061 is therefore inhibition of DNA2 DNA Replication Helicase 2-like (yeast) (DNA2L, Accession XM_166103), a gene which acts as a template for DNA polymerization during the process of DNA replica-

tion. Accordingly, utilities of VGAM2061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNA2L. The function of DNA2L has been established by previous studies. While sequencing random cDNAs from the myeloid cell line KG-1, Nagase et al. (1995) found a partial sequence, KIAA0083, whose predicted polypeptide sequence had 41% identity to yeast Dna2 helicase. In yeast, Dna2 helicase is a DNA-dependent ATPase which unwinds duplex DNA to generate single-stranded DNA which then acts as a template for DNA polymerization during the process of DNA replication. Eki et al. (1996) used human-rodent PCR panels and fluorescence in situ hybridization to map the human DNA2L gene to human chromosome 10q21.3-q22.1.

[72092] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[72093] Eki, T; Okumura, K.; Shiratori, A.; Abe, M.; Nogami, M.; Taguchi, H.; Shibata, T.; Murakami, Y.; Hanaoka, F. : Assignment of the closest human homologue (DNA2L; KIAA0083) of the yeast Dna2 helicase gene to chromosome band 10q21.3-q22.1 Genomics 37: 408-410, 1996. ; and

[72094] Nagase, T; Miyajima, N; Tanaka, A.; Sazuka, T.; Seki, N.; Sato, S.; Tabata, S.; Ishikawa, K.; Kawarabayashi, Y.; Kotani, H.; Nomura, N. : Prediction of the coding sequences of unidentif.

[72095] Further studies establishing the function and utilities of DNA2L are found in John Hopkins OMIM database record ID 601810, and in sited publications numbered 6725-6726 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Ribosomal Protein L10 (RPL10, Accession NM_006013) is another VGAM2061 host target gene. RPL10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RPL10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPL10 BINDING SITE, designated SEQ ID:12622, to the nucleotide sequence of VGAM2061 RNA, herein designated VGAM RNA, also designated SEQ ID:4772.

[72096] Another function of VGAM2061 is therefore inhibition of Ribosomal Protein L10 (RPL10, Accession NM_006013), a gene which may be a component of the 60S ribosomal

subunit. Accordingly, utilities of VGAM2061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPL10. The function of RPL10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM476.DKFZP566M114 (Accession NM_032128) is another VGAM2061 host target gene. DKFZP566M114 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP566M114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566M114 BINDING SITE, designated SEQ ID:25813, to the nucleotide sequence of VGAM2061 RNA, herein designated VGAM RNA, also designated SEQ ID:4772.

[72097] Another function of VGAM2061 is therefore inhibition of DKFZP566M114 (Accession NM_032128). Accordingly, utilities of VGAM2061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566M114. FLJ20519 (Accession NM_017860) is another VGAM2061 host target gene. FLJ20519 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20519 BINDING SITE, designated SEQ ID:19539, to the nucleotide sequence of VGAM2061 RNA, herein designated VGAM RNA, also designated SEQ ID:4772.

[72098] Another function of VGAM2061 is therefore inhibition of FLJ20519 (Accession NM_017860). Accordingly, utilities of VGAM2061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20519. FLJ21369 (Accession NM_024802) is another VGAM2061 host target gene. FLJ21369 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21369, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21369 BINDING SITE, designated SEQ ID:24182, to the nucleotide sequence of VGAM2061 RNA, herein designated VGAM RNA, also designated SEQ ID:4772.

[72099] Another function of VGAM2061 is therefore inhibition of

FLJ21369 (Accession NM_024802). Accordingly, utilities of VGAM2061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21369. FLJ23462 (Accession NM_024843) is another VGAM2061 host target gene. FLJ23462 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23462 BINDING SITE, designated SEQ ID:24259, to the nucleotide sequence of VGAM2061 RNA, herein designated VGAM RNA, also designated SEQ ID:4772.

[72100] Another function of VGAM2061 is therefore inhibition of FLJ23462 (Accession NM_024843). Accordingly, utilities of VGAM2061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23462. KIAA1237 (Accession XM_087386) is another VGAM2061 host target gene. KIAA1237 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1237 BINDING SITE, designated SEQ ID:39214, to the nucleotide sequence of VGAM2061 RNA, herein designated VGAM RNA, also designated SEQ ID:4772.

[72101] Another function of VGAM2061 is therefore inhibition of KIAA1237 (Accession XM_087386). Accordingly, utilities of VGAM2061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1237. KIAA1554 (Accession XM_170834) is another VGAM2061 host target gene. KIAA1554 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1554, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1554 BINDING SITE, designated SEQ ID:45613, to the nucleotide sequence of VGAM2061 RNA, herein designated VGAM RNA, also designated SEQ ID:4772.

[72102] Another function of VGAM2061 is therefore inhibition of KIAA1554 (Accession XM_170834). Accordingly, utilities of VGAM2061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1554. Ornithine Decarboxylase Antizyme Inhibitor

(OAZIN, Accession NM_015878) is another VGAM2061 host target gene. OAZIN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OAZIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OAZIN BINDING SITE, designated SEQ ID:18022, to the nucleotide sequence of VGAM2061 RNA, herein designated VGAM RNA, also designated SEQ ID:4772.

[72103] Another function of VGAM2061 is therefore inhibition of Ornithine Decarboxylase Antizyme Inhibitor (OAZIN, Accession NM_015878). Accordingly, utilities of VGAM2061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAZIN. LOC147072 (Accession XM_017121) is another VGAM2061 host target gene. LOC147072 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147072 BINDING SITE, designated SEQ ID:30300, to the nucleotide sequence of

VGAM2061 RNA, herein designated VGAM RNA, also designated SEQ ID:4772.

[72104] Another function of VGAM2061 is therefore inhibition of LOC147072 (Accession XM_017121). Accordingly, utilities of VGAM2061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147072. LOC147093 (Accession XM_097184) is another VGAM2061 host target gene. LOC147093 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147093 BINDING SITE, designated SEQ ID:40803, to the nucleotide sequence of VGAM2061 RNA, herein designated VGAM RNA, also designated SEQ ID:4772.

[72105] Another function of VGAM2061 is therefore inhibition of LOC147093 (Accession XM_097184). Accordingly, utilities of VGAM2061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147093. LOC201626 (Accession XM_114349) is another VGAM2061 host target gene. LOC201626 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC201626, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201626 BINDING SITE, designated SEQ ID:42889, to the nucleotide sequence of VGAM2061 RNA, herein designated VGAM RNA, also designated SEQ ID:4772.

[72106] Another function of VGAM2061 is therefore inhibition of LOC201626 (Accession XM_114349). Accordingly, utilities of VGAM2061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201626. LOC93097 (Accession XM_049221) is another VGAM2061 host target gene. LOC93097 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC93097, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93097 BINDING SITE, designated SEQ ID:35356, to the nucleotide sequence of VGAM2061 RNA, herein designated VGAM RNA, also designated SEQ ID:4772.

[72107] Another function of VGAM2061 is therefore inhibition of LOC93097 (Accession XM_049221). Accordingly, utilities

of VGAM2061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93097. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2062 (VGAM2062) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72108] VGAM2062 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2062 was detected is described hereinabove with reference to Figs. 1-8.

[72109] VGAM2062 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Peanut Bud Necrosis Virus. VGAM2062 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72110] VGAM2062 gene encodes a VGAM2062 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2062 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2062 precursor RNA is designated SEQ ID:2048, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2048 is located at position 345 relative to the genome of Peanut Bud Necrosis Virus.

[72111] VGAM2062 precursor RNA folds onto itself, forming VGAM2062 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72112] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2062 folded precursor RNA into VGAM2062 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2062 RNA is designated SEQ ID:4773, and

is provided hereinbelow with reference to the sequence listing part.

[72113] VGAM2062 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2062 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2062 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72114] VGAM2062 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2062 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2062 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2062 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2062 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72115] The complementary binding of VGAM2062 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2062 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2062 host target RNA into VGAM2062 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72116] It is appreciated that VGAM2062 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2062 host target genes. The mRNA of each one of this plurality of VGAM2062 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2062 RNA, herein designated VGAM RNA, and which when bound by VGAM2062 RNA causes inhibition of translation of respective one or more VGAM2062 host target proteins.

[72117] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2062 gene, herein designated VGAM GENE, on one or more VGAM2062 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72118] It is yet further appreciated that a function of VGAM2062 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of viral infection by Peanut Bud Necrosis Virus. Specific functions, and accordingly utilities, of VGAM2062 correlate with, and may be deduced from, the identity of the host target genes which VGAM2062 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72119] Nucleotide sequences of the VGAM2062 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2062 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2062 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2062 are further described hereinbelow with reference to Table 1.

[72120] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2062 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2062 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72121] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2062 gene, herein designated VGAM is inhibition of expression of VGAM2062 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2062 correlate with, and may be deduced from, the identity of the target genes which VGAM2062 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72122] Bassoon (presynaptic cytomatrix protein) (BSN, Accession NM_003458) is a VGAM2062 host target gene. BSN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BSN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BSN BINDING SITE, designated SEQ ID:9516, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72123] A function of VGAM2062 is therefore inhibition of Bassoon (presynaptic cytomatrix protein) (BSN, Accession NM_003458), a gene which may be involved in cytomatrix organization at the site of neurotransmitter release. Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with BSN. The function of BSN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM638.DXS1283E (Accession XM_047871) is another VGAM2062 host target gene. DXS1283E BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DXS1283E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DXS1283E BINDING SITE, designated SEQ ID:35067, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72124] Another function of VGAM2062 is therefore inhibition of DXS1283E (Accession XM_047871). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DXS1283E. IL2-inducible T-cell Kinase (ITK, Accession NM_005546) is another VGAM2062 host target gene. ITK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITK, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITK BINDING SITE, designated SEQ ID:12078, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72125] Another function of VGAM2062 is therefore inhibition of IL2-inducible T-cell Kinase (ITK, Accession NM_005546), a gene which plays a role in t cell proliferation and differentiation. Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITK. The function of ITK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM288.Protocadherin 11 X-linked (PCDH11X, Accession NM_032969) is another VGAM2062 host target gene. PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDH11X, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2, designated SEQ ID:26805 and SEQ

ID:26790 respectively, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72126] Another function of VGAM2062 is therefore inhibition of Protocadherin 11 X-linked (PCDH11X, Accession NM_032969), a gene which is thought to play a fundamental role in cell-cell recognition essential for the segmental development and function of the central nervous system. Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11X. The function of PCDH11X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433.Replication Protein A1, 70kDa (RPA1, Accession NM_002945) is another VGAM2062 host target gene. RPA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RPA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPA1 BINDING SITE, designated SEQ ID:8855, to the nucleotide sequence of VGAM2062 RNA, herein

designated VGAM RNA, also designated SEQ ID:4773.

[72127] Another function of VGAM2062 is therefore inhibition of Replication Protein A1, 70kDa (RPA1, Accession NM_002945), a gene which is required for simian virus 40 dna replication in vitro. it participates in a very early step in initiation. rp-a is a single-stranded dna-binding protein. Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPA1. The function of RPA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180.Serine (or cysteine) Proteinase Inhibitor, Clade A (alpha-1 antiproteinase, antitrypsin), Member 5 (SERPINA5, Accession NM_000624) is another VGAM2062 host target gene. SERPINA5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SERPINA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERPINA5 BINDING SITE, designated SEQ ID:6241, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ

ID:4773.

[72128] Another function of VGAM2062 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade A (alpha-1 antiproteinase, antitrypsin), Member 5 (SERPINA5, Accession NM_000624), a gene which inhibits activated protein c as well as plasminogen activators. Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINA5. The function of SERPINA5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1233.ARL8 (Accession XM_167671) is another VGAM2062 host target gene. ARL8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARL8 BINDING SITE, designated SEQ ID:44766, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72129] Another function of VGAM2062 is therefore inhibition of ARL8 (Accession XM_167671). Accordingly, utilities of

VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARL8. Chromosome 1 Open Reading Frame 22 (C1orf22, Accession NM_025191) is another VGAM2062 host target gene. C1orf22 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf22 BINDING SITE, designated SEQ ID:24841, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72130] Another function of VGAM2062 is therefore inhibition of Chromosome 1 Open Reading Frame 22 (C1orf22, Accession NM_025191). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf22. Chromosome 20 Open Reading Frame 20 (C20orf20, Accession NM_018270) is another VGAM2062 host target gene. C20orf20 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf20, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf20 BINDING SITE, designated SEQ ID:20244, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72131] Another function of VGAM2062 is therefore inhibition of Chromosome 20 Open Reading Frame 20 (C20orf20, Accession NM_018270). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf20. Chromosome 9 Open Reading Frame 12 (C9orf12, Accession NM_022755) is another VGAM2062 host target gene. C9orf12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C9orf12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf12 BINDING SITE, designated SEQ ID:22992, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72132] Another function of VGAM2062 is therefore inhibition of

Chromosome 9 Open Reading Frame 12 (C9orf12, Accession NM_022755). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf12. CDC14 Cell Division Cycle 14 Homolog B (S. cerevisiae) (CDC14B, Accession NM_003671) is another VGAM2062 host target gene. CDC14B BINDING SITE1 and CDC14B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CDC14B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE1 and CDC14B BINDING SITE2, designated SEQ ID:9762 and SEQ ID:27165 respectively, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72133] Another function of VGAM2062 is therefore inhibition of CDC14 Cell Division Cycle 14 Homolog B (S. cerevisiae) (CDC14B, Accession NM_003671). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B. Ephrin-A5 (EFNA5, Accession NM_001962) is another VGAM2062 host target gene. EFNA5 BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EFNA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFNA5 BINDING SITE, designated SEQ ID:7686, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72134] Another function of VGAM2062 is therefore inhibition of Ephrin-A5 (EFNA5, Accession NM_001962). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFNA5. FLJ12409 (Accession NM_025105) is another VGAM2062 host target gene. FLJ12409 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12409, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12409 BINDING SITE, designated SEQ ID:24753, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72135] Another function of VGAM2062 is therefore inhibition of

FLJ12409 (Accession NM_025105). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12409. FLJ12604 (Accession XM_035022) is another VGAM2062 host target gene. FLJ12604 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12604, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12604 BINDING SITE, designated SEQ ID:32191, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72136] Another function of VGAM2062 is therefore inhibition of FLJ12604 (Accession XM_035022). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12604. FLJ14640 (Accession NM_032816) is another VGAM2062 host target gene. FLJ14640 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14640, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ14640 BINDING SITE, designated SEQ ID:26586, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72137] Another function of VGAM2062 is therefore inhibition of FLJ14640 (Accession NM_032816). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14640. FLJ20413 (Accession NM_017808) is another VGAM2062 host target gene. FLJ20413 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20413, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20413 BINDING SITE, designated SEQ ID:19453, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72138] Another function of VGAM2062 is therefore inhibition of FLJ20413 (Accession NM_017808). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20413. H_GS165L15.1 (Accession NM_004904) is an-

other VGAM2062 host target gene. H_GS165L15.1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by H_GS165L15.1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H_GS165L15.1 BINDING SITE, designated SEQ ID:11339, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72139] Another function of VGAM2062 is therefore inhibition of H_GS165L15.1 (Accession NM_004904). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H_GS165L15.1. HN1L (Accession NM_144570) is another VGAM2062 host target gene. HN1L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HN1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HN1L BINDING SITE, designated SEQ ID:29375, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA,

also designated SEQ ID:4773.

[72140] Another function of VGAM2062 is therefore inhibition of HN1L (Accession NM_144570). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HN1L. KIAA0379 (Accession XM_042860) is another VGAM2062 host target gene. KIAA0379 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0379, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0379 BINDING SITE, designated SEQ ID:33813, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72141] Another function of VGAM2062 is therefore inhibition of KIAA0379 (Accession XM_042860). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0379. KIAA0560 (Accession XM_029045) is another VGAM2062 host target gene. KIAA0560 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0560, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0560 BINDING SITE, designated SEQ ID:30838, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72142] Another function of VGAM2062 is therefore inhibition of KIAA0560 (Accession XM_029045). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0560. KIAA0916 (Accession NM_015057) is another VGAM2062 host target gene. KIAA0916 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0916, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0916 BINDING SITE, designated SEQ ID:17417, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72143] Another function of VGAM2062 is therefore inhibition of KIAA0916 (Accession NM_015057). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0916. KIAA1211 (Accession XM_044178) is another VGAM2062 host target gene. KIAA1211 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1211 BINDING SITE, designated SEQ ID:34163, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72144] Another function of VGAM2062 is therefore inhibition of KIAA1211 (Accession XM_044178). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1211. KIAA1376 (Accession XM_033042) is another VGAM2062 host target gene. KIAA1376 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1376, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1376 BINDING SITE, designated SEQ ID:31823, to the

nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72145] Another function of VGAM2062 is therefore inhibition of KIAA1376 (Accession XM_033042). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1376. MBLL39 (Accession NM_144778) is another VGAM2062 host target gene. MBLL39 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MBLL39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBLL39 BINDING SITE, designated SEQ ID:29570, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72146] Another function of VGAM2062 is therefore inhibition of MBLL39 (Accession NM_144778). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBLL39. N-ethylmaleimide-sensitive Factor Attachment Protein, Gamma (NAPG, Accession XM_172983) is another VGAM2062 host target gene. NAPG BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by NAPG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAPG BINDING SITE, designated SEQ ID:46254, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72147] Another function of VGAM2062 is therefore inhibition of N-ethylmaleimide-sensitive Factor Attachment Protein, Gamma (NAPG, Accession XM_172983). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAPG. Pellino Homolog 2 (Drosophila) (PELI2, Accession NM_021255) is another VGAM2062 host target gene. PELI2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PELI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PELI2 BINDING SITE, designated SEQ ID:22231, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72148] Another function of VGAM2062 is therefore inhibition of Pellino Homolog 2 (Drosophila) (PELI2, Accession NM_021255). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PELI2. Protein Serine Kinase H1 (PSKH1, Accession XM_043047) is another VGAM2062 host target gene. PSKH1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PSKH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSKH1 BINDING SITE, designated SEQ ID:33868, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72149] Another function of VGAM2062 is therefore inhibition of Protein Serine Kinase H1 (PSKH1, Accession XM_043047). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSKH1. SEC14-like 2 (S. cerevisiae) (SEC14L2, Accession NM_012429) is another VGAM2062 host target gene. SEC14L2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA

encoded by SEC14L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC14L2 BINDING SITE, designated SEQ ID:14806, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72150] Another function of VGAM2062 is therefore inhibition of SEC14-like 2 (S. cerevisiae) (SEC14L2, Accession NM_012429). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC14L2. Zinc Finger Protein 339 (ZNF339, Accession NM_021220) is another VGAM2062 host target gene. ZNF339 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF339, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF339 BINDING SITE, designated SEQ ID:22200, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72151] Another function of VGAM2062 is therefore inhibition of

Zinc Finger Protein 339 (ZNF339, Accession NM_021220). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF339. LOC138654 (Accession XM_071015) is another VGAM2062 host target gene. LOC138654 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC138654, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138654 BINDING SITE, designated SEQ ID:37397, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72152] Another function of VGAM2062 is therefore inhibition of LOC138654 (Accession XM_071015). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138654. LOC142948 (Accession XM_096364) is another VGAM2062 host target gene. LOC142948 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC142948, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142948 BINDING SITE, designated SEQ ID:40326, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72153] Another function of VGAM2062 is therefore inhibition of LOC142948 (Accession XM_096364). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142948. LOC143916 (Accession XM_084664) is another VGAM2062 host target gene. LOC143916 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143916, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143916 BINDING SITE, designated SEQ ID:37654, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72154] Another function of VGAM2062 is therefore inhibition of LOC143916 (Accession XM_084664). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC143916. LOC145439 (Accession XM_085144) is another VGAM2062 host target gene. LOC145439 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145439, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145439 BINDING SITE, designated SEQ ID:37866, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72155] Another function of VGAM2062 is therefore inhibition of LOC145439 (Accession XM_085144). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145439. LOC147178 (Accession XM_028755) is another VGAM2062 host target gene. LOC147178 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147178 BINDING SITE, designated SEQ ID:30744, to the nucleotide sequence of VGAM2062 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4773.

[72156] Another function of VGAM2062 is therefore inhibition of LOC147178 (Accession XM_028755). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147178. LOC151194 (Accession NM_145280) is another VGAM2062 host target gene. LOC151194 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151194, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151194 BINDING SITE, designated SEQ ID:29798, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72157] Another function of VGAM2062 is therefore inhibition of LOC151194 (Accession NM_145280). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151194. LOC153416 (Accession XM_018473) is another VGAM2062 host target gene. LOC153416 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153416, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153416 BINDING SITE, designated SEQ ID:30361, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72158] Another function of VGAM2062 is therefore inhibition of LOC153416 (Accession XM_018473). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153416. LOC157450 (Accession XM_048209) is another VGAM2062 host target gene. LOC157450 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157450 BINDING SITE, designated SEQ ID:35146, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72159] Another function of VGAM2062 is therefore inhibition of LOC157450 (Accession XM_048209). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC157450. LOC157556 (Accession XM_098783) is another VGAM2062 host target gene. LOC157556 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157556 BINDING SITE, designated SEQ ID:41823, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72160] Another function of VGAM2062 is therefore inhibition of LOC157556 (Accession XM_098783). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157556. LOC158629 (Accession XM_098972) is another VGAM2062 host target gene. LOC158629 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158629, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158629 BINDING SITE, designated SEQ ID:42020, to

the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72161] Another function of VGAM2062 is therefore inhibition of LOC158629 (Accession XM_098972). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158629. LOC200301 (Accession XM_114197) is another VGAM2062 host target gene. LOC200301 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200301 BINDING SITE, designated SEQ ID:42784, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72162] Another function of VGAM2062 is therefore inhibition of LOC200301 (Accession XM_114197). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200301. LOC220790 (Accession XM_166037) is another VGAM2062 host target gene. LOC220790 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC220790, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220790 BINDING SITE, designated SEQ ID:43838, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72163] Another function of VGAM2062 is therefore inhibition of LOC220790 (Accession XM_166037). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220790. LOC221795 (Accession XM_166491) is another VGAM2062 host target gene. LOC221795 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221795 BINDING SITE, designated SEQ ID:44424, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72164] Another function of VGAM2062 is therefore inhibition of LOC221795 (Accession XM_166491). Accordingly, utilities

of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221795. LOC257019 (Accession XM_171208) is another VGAM2062 host target gene. LOC257019 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257019, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257019 BINDING SITE, designated SEQ ID:45995, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72165] Another function of VGAM2062 is therefore inhibition of LOC257019 (Accession XM_171208). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257019. LOC91664 (Accession XM_039908) is another VGAM2062 host target gene. LOC91664 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91664, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC91664 BINDING SITE, designated SEQ ID:33213, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72166] Another function of VGAM2062 is therefore inhibition of LOC91664 (Accession XM_039908). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91664. LOC93320 (Accession XM_050534) is another VGAM2062 host target gene. LOC93320 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93320 BINDING SITE, designated SEQ ID:35655, to the nucleotide sequence of VGAM2062 RNA, herein designated VGAM RNA, also designated SEQ ID:4773.

[72167] Another function of VGAM2062 is therefore inhibition of LOC93320 (Accession XM_050534). Accordingly, utilities of VGAM2062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93320. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2063 (VGAM2063) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72168] VGAM2063 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2063 was detected is described hereinabove with reference to Figs. 1-8.

[72169] VGAM2063 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2063 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72170] VGAM2063 gene encodes a VGAM2063 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2063 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2063 precursor RNA is designated SEQ ID:2049, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2049 is located at position 7074 relative to the

genome of Ectromelia Virus.

[72171] VGAM2063 precursor RNA folds onto itself, forming VGAM2063 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72172] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2063 folded precursor RNA into VGAM2063 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2063 RNA is designated SEQ ID:4774, and is provided hereinbelow with reference to the sequence listing part.

[72173] VGAM2063 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2063 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2063 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72174] VGAM2063 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2063 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2063 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2063 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2063 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72175] The complementary binding of VGAM2063 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2063 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2063 host target RNA into VGAM2063 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72176] It is appreciated that VGAM2063 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2063 host target genes. The mRNA of each one of this plurality of VGAM2063 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2063 RNA, herein designated VGAM RNA, and which when bound by VGAM2063 RNA causes inhibition of translation of respective one or more VGAM2063 host target proteins.

[72177] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2063 gene, herein designated VGAM GENE, on one or more VGAM2063 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72178] It is yet further appreciated that a function of VGAM2063 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2063 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2063 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2063 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72179] Nucleotide sequences of the VGAM2063 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2063 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2063 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2063 are further described hereinbelow with reference to Table 1.

[72180] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2063 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2063 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72181] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2063 gene, herein designated VGAM is inhibition of expression of VGAM2063 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2063 correlate with, and may be deduced

from, the identity of the target genes which VGAM2063 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72182] Diacylglycerol Kinase, Beta 90kDa (DGKB, Accession XM_166516) is a VGAM2063 host target gene. DGKB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DGKB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKB BINDING SITE, designated SEQ ID:44447, to the nucleotide sequence of VGAM2063 RNA, herein designated VGAM RNA, also designated SEQ ID:4774.

[72183] A function of VGAM2063 is therefore inhibition of Diacylglycerol Kinase, Beta 90kDa (DGKB, Accession XM_166516), a gene which regulates the intracellular concentration of the second messenger diacylglycerol (DAG). Accordingly, utilities of VGAM2063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKB. The function of DGKB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM497.Myelin Oligoden-

drocyte Glycoprotein (MOG, Accession NM_002433) is another VGAM2063 host target gene. MOG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MOG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOG BINDING SITE, designated SEQ ID:8278, to the nucleotide sequence of VGAM2063 RNA, herein designated VGAM RNA, also designated SEQ ID:4774.

[72184] Another function of VGAM2063 is therefore inhibition of Myelin Oligodendrocyte Glycoprotein (MOG, Accession NM_002433). Accordingly, utilities of VGAM2063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOG. SAC1 Suppressor of Actin Mutations 1-like (yeast) (SACM1L, Accession NM_014016) is another VGAM2063 host target gene. SACM1L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SACM1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SACM1L BINDING SITE, designated SEQ

ID:15236, to the nucleotide sequence of VGAM2063 RNA, herein designated VGAM RNA, also designated SEQ ID:4774.

[72185] Another function of VGAM2063 is therefore inhibition of SAC1 Suppressor of Actin Mutations 1-like (yeast) (SACM1L, Accession NM_014016), a gene which suggests the presence of a tumor suppressor gene. Accordingly, utilities of VGAM2063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SACM1L. The function of SACM1L has been established by previous studies. 2. Chen, Y.; Cann, M. J.; Litvin, T. N.; Iourgenko, V.; Sinclair, M. L.; Levin, L. R.; Buck, J. : Soluble adenylyl cyclase as an evolutionarily conserved bicarbonate sensor. Science 289: 625-628, 2000. PubMed ID : 10915626 3. Reed, B. Y.; Gitomer, W. L.; Heller, H. J.; Hsu, M. [72189] Further studies establishing the function and utilities of SACM1L are found in John Hopkins OMIM database record ID 606569, and in sited publications numbered 555 and 6104 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Vascular Cell Adhesion Molecule 1 (VCAM1, Accession NM_080682) is another VGAM2063 host target gene. VCAM1 BINDING SITE1 and VCAM1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by VCAM1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VCAM1 BINDING SITE1 and VCAM1 BINDING SITE2, designated SEQ ID:27985 and SEQ ID:6739 respec-

tively, to the nucleotide sequence of VGAM2063 RNA, herein designated VGAM RNA, also designated SEQ ID:4774.

[72190] Another function of VGAM2063 is therefore inhibition of Vascular Cell Adhesion Molecule 1 (VCAM1, Accession NM_080682). Accordingly, utilities of VGAM2063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VCAM1. FLJ00060 (Accession XM_028154) is another VGAM2063 host target gene. FLJ00060 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00060, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00060 BINDING SITE, designated SEQ ID:30626, to the nucleotide sequence of VGAM2063 RNA, herein designated VGAM RNA, also designated SEQ ID:4774.

[72191] Another function of VGAM2063 is therefore inhibition of FLJ00060 (Accession XM_028154). Accordingly, utilities of VGAM2063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00060. KIAA0419 (Accession NM_014711) is another

VGAM2063 host target gene. KIAA0419 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0419, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0419 BINDING SITE, designated SEQ ID:16259, to the nucleotide sequence of VGAM2063 RNA, herein designated VGAM RNA, also designated SEQ ID:4774.

[72192] Another function of VGAM2063 is therefore inhibition of KIAA0419 (Accession NM_014711). Accordingly, utilities of VGAM2063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0419. Lipoma HMGIC Fusion Partner-like 2 (LHFPL2, Accession XM_046054) is another VGAM2063 host target gene. LHFPL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LHFPL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHFPL2 BINDING SITE, designated SEQ ID:34659, to the nucleotide sequence of VGAM2063 RNA, herein designated VGAM RNA, also designated SEQ

ID:4774.

[72193] Another function of VGAM2063 is therefore inhibition of Lipoma HMGIC Fusion Partner-like 2 (LHFPL2, Accession XM_046054). Accordingly, utilities of VGAM2063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHFPL2. LOC256683 (Accession XM_172321) is another VGAM2063 host target gene. LOC256683 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256683, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256683 BINDING SITE, designated SEQ ID:46069, to the nucleotide sequence of VGAM2063 RNA, herein designated VGAM RNA, also designated SEQ ID:4774.

[72194] Another function of VGAM2063 is therefore inhibition of LOC256683 (Accession XM_172321). Accordingly, utilities of VGAM2063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256683. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 2064 (VGAM2064) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72195] VGAM2064 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2064 was detected is described hereinabove with reference to Figs. 1-8.

[72196] VGAM2064 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Peanut Bud Necrosis Virus. VGAM2064 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72197] VGAM2064 gene encodes a VGAM2064 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2064 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2064 precursor RNA is designated SEQ ID:2050, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2050 is located at position 3726 relative to the genome of Peanut Bud Necrosis Virus.

[72198] VGAM2064 precursor RNA folds onto itself, forming VGAM2064 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72199] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2064 folded precursor RNA into VGAM2064 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2064 RNA is designated SEQ ID:4775, and is provided hereinbelow with reference to the sequence listing part.

[72200] VGAM2064 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2064 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2064 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72201] VGAM2064 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2064 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2064 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2064 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2064 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72202] The complementary binding of VGAM2064 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2064 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2064 host target RNA into VGAM2064 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72203] It is appreciated that VGAM2064 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2064 host target genes. The mRNA of each one of this plurality of VGAM2064 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2064 RNA, herein designated VGAM RNA, and which when bound by VGAM2064 RNA causes inhibition of translation of respective one or more VGAM2064 host target proteins.

[72204] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2064 gene, herein designated VGAM GENE, on one or more VGAM2064 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72205] It is yet further appreciated that a function of VGAM2064 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2064 include diagnosis, prevention and treatment of viral infection by Peanut Bud Necrosis Virus. Specific functions, and accordingly utilities, of VGAM2064 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2064 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72206] Nucleotide sequences of the VGAM2064 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2064 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2064 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2064 are further described hereinbelow with reference to Table 1.

[72207] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2064 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2064 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72208] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2064 gene, herein designated VGAM is inhibition of expression of VGAM2064 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2064 correlate with, and may be deduced from, the identity of the target genes which VGAM2064

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72209] CD44 Antigen (homing function and Indian blood group system) (CD44, Accession NM_000610) is a VGAM2064 host target gene. CD44 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CD44, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD44 BINDING SITE, designated SEQ ID:6212, to the nucleotide sequence of VGAM2064 RNA, herein designated VGAM RNA, also designated SEQ ID:4775.

[72210] A function of VGAM2064 is therefore inhibition of CD44 Antigen (homing function and Indian blood group system) (CD44, Accession NM_000610), a gene which is main cell surface receptor for hyaluronate, and involves in matrix adhesion, lymphocyte activation and lymph node homing. Accordingly, utilities of VGAM2064 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD44. The function of CD44 and its association with various diseases and clinical conditions, has been established by previous studies, as described

hereinabove with reference to VGAM1928.Mitochondrial Ribosomal Protein L49 (MRPL49, Accession XM_045499) is another VGAM2064 host target gene. MRPL49 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MRPL49, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL49 BINDING SITE, designated SEQ ID:34476, to the nucleotide sequence of VGAM2064 RNA, herein designated VGAM RNA, also designated SEQ ID:4775.

[72211] Another function of VGAM2064 is therefore inhibition of Mitochondrial Ribosomal Protein L49 (MRPL49, Accession XM_045499). Accordingly, utilities of VGAM2064 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL49. Neuronal Pentraxin I (NPTX1, Accession NM_002522) is another VGAM2064 host target gene. NPTX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NPTX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPTX1 BINDING SITE,

designated SEQ ID:8354, to the nucleotide sequence of VGAM2064 RNA, herein designated VGAM RNA, also designated SEQ ID:4775.

[72212] Another function of VGAM2064 is therefore inhibition of Neuronal Pentraxin I (NPTX1, Accession NM_002522), a gene which may be involved in synaptic uptake of extracellular material and is very strongly similar to rat NP1. Accordingly, utilities of VGAM2064 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPTX1. The function of NPTX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM111.Staufen, RNA Binding Protein (Drosophila) (STAU, Accession NM_004602) is another VGAM2064 host target gene. STAU BINDING SITE1 through STAU BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by STAU, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAU BINDING SITE1 through STAU BINDING SITE4, designated SEQ ID:10943, SEQ ID:18915, SEQ ID:18921 and SEQ ID:18927 respec-

tively, to the nucleotide sequence of VGAM2064 RNA, herein designated VGAM RNA, also designated SEQ ID:4775.

[72213] Another function of VGAM2064 is therefore inhibition of Staufen, RNA Binding Protein (Drosophila) (STAU, Accession NM_004602), a gene which may play a role in specific positioning of mrnas at given sites in the cell and in stimulating their translation at the site. Accordingly, utilities of VGAM2064 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAU. The function of STAU and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM916.Hairy/enhancer-of-split Related with YRPW Motif 1 (HEY1, Accession XM_166062) is another VGAM2064 host target gene. HEY1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HEY1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEY1 BINDING SITE, designated SEQ ID:43847, to the nucleotide sequence of VGAM2064 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4775.

[72214] Another function of VGAM2064 is therefore inhibition of Hairy/enhancer-of-split Related with YRPW Motif 1 (HEY1, Accession XM_166062). Accordingly, utilities of VGAM2064 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEY1. KIAA0335 (Accession NM_014803) is another VGAM2064 host target gene. KIAA0335 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0335, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0335 BINDING SITE, designated SEQ ID:16731, to the nucleotide sequence of VGAM2064 RNA, herein designated VGAM RNA, also designated SEQ ID:4775.

[72215] Another function of VGAM2064 is therefore inhibition of KIAA0335 (Accession NM_014803). Accordingly, utilities of VGAM2064 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0335. KIAA0763 (Accession NM_014869) is another VGAM2064 host target gene. KIAA0763 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA0763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0763 BINDING SITE, designated SEQ ID:16967, to the nucleotide sequence of VGAM2064 RNA, herein designated VGAM RNA, also designated SEQ ID:4775.

[72216] Another function of VGAM2064 is therefore inhibition of KIAA0763 (Accession NM_014869). Accordingly, utilities of VGAM2064 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0763. LOC221683 (Accession XM_168089) is another VGAM2064 host target gene. LOC221683 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221683, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221683 BINDING SITE, designated SEQ ID:45002, to the nucleotide sequence of VGAM2064 RNA, herein designated VGAM RNA, also designated SEQ ID:4775.

[72217] Another function of VGAM2064 is therefore inhibition of LOC221683 (Accession XM_168089). Accordingly, utilities

of VGAM2064 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221683. LOC91445 (Accession XM_018516) is another VGAM2064 host target gene. LOC91445 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91445 BINDING SITE, designated SEQ ID:30370, to the nucleotide sequence of VGAM2064 RNA, herein designated VGAM RNA, also designated SEQ ID:4775.

[72218] Another function of VGAM2064 is therefore inhibition of LOC91445 (Accession XM_018516). Accordingly, utilities of VGAM2064 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91445. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2065 (VGAM2065) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72219] VGAM2065 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2065 was detected is described hereinabove with reference to Figs. 1-8.

[72220] VGAM2065 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2065 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72221] VGAM2065 gene encodes a VGAM2065 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2065 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2065 precursor RNA is designated SEQ ID:2051, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2051 is located at position 18973 relative to the genome of Ectromelia Virus.

[72222] VGAM2065 precursor RNA folds onto itself, forming VGAM2065 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72223] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2065 folded precursor RNA into VGAM2065 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM2065 RNA is designated SEQ ID:4776, and is provided hereinbelow with reference to the sequence listing part.

[72224] VGAM2065 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2065 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2065 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[72225] VGAM2065 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2065 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2065 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2065 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2065 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72226] The complementary binding of VGAM2065 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2065 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2065 host target RNA into VGAM2065 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72227] It is appreciated that VGAM2065 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2065 host target genes. The mRNA of each one of this plurality of VGAM2065 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2065 RNA, herein designated VGAM RNA, and which when bound by VGAM2065 RNA causes inhibition of translation of respective one or more VGAM2065 host target proteins.

[72228] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2065 gene, herein designated VGAM GENE, on one or more VGAM2065 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72229] It is yet further appreciated that a function of VGAM2065 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2065 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2065 correlate with, and may be deduced from, the identity of the host target genes which VGAM2065 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72230] Nucleotide sequences of the VGAM2065 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2065 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2065 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2065 are further described hereinbelow with reference to Table 1.

[72231] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2065 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2065 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72232] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2065 gene, herein designated VGAM is inhibition of expression of VGAM2065 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2065 correlate with, and may be deduced from, the identity of the target genes which VGAM2065 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72233] APM1 (Accession NM_004797) is a VGAM2065 host target gene. APM1 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by APM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APM1 BINDING SITE, designated SEQ ID:11208, to the nucleotide sequence of VGAM2065 RNA, herein designated VGAM RNA, also designated SEQ ID:4776.

[72234] A function of VGAM2065 is therefore inhibition of APM1 (Accession NM_004797). Accordingly, utilities of VGAM2065 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APM1. Protein Kinase C, Beta 1 (PRKCB1, Accession XM_047187) is another VGAM2065 host target gene. PRKCB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRKCB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKCB1 BINDING SITE, designated SEQ ID:34903, to the nucleotide sequence of VGAM2065 RNA, herein designated VGAM RNA, also designated SEQ ID:4776.

[72235] Another function of VGAM2065 is therefore inhibition of Protein Kinase C, Beta 1 (PRKCB1, Accession XM_047187),

a gene which is a calcium-activated, phospholipid-dependent, serine- and threonine-specific enzyme. Accordingly, utilities of VGAM2065 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKCB1. The function of PRKCB1 has been established by previous studies. Greenham et al. (1998) determined the genomic structure of the PRKCB gene. The PRKCB gene consists of 18 exons spanning 375 kb, with a particularly large intron of over 150 kb between exons 2 and 3. Exons range from 32 to 174 bp in length. Francke et al. (1989) stated that the most likely location of PKCB is 16p11.2. Animal model experiments lend further support to the function of PRKCB1. Leitges et al. (1996) found that mice homozygous for a targeted disruption of the Prkcb1 gene develop an immunodeficiency characterized by impaired humoral immune responses and reduced cellular responses of B cells similar to X-linked immunodeficiency (Xid) in mice (see OMIM Ref. No. 300300). Thus, they concluded that the 2 isoforms, PKC-beta-I (OMIM Ref. No. PRKCB1) and PKC-beta-II (OMIM Ref. No. PRKCB2), play an important role in B-cell activation and may be functionally linked to Bruton tyrosine kinase (OMIM Ref. No. 300300) in antigen receptor-mediated signal transduction. Su et al.

(2002) showed that mice lacking Prkcb are unable to activate Nfkb (OMIM Ref. No. 164011) and promote cell survival in B cells upon BCR signaling, or even in mast cells which, unlike B cells, also express Prkcq (OMIM Ref. No. 600448). The failure to activate Nfkb is associated with a lack of Ikba (OMIM Ref. No. 164008) degradation as well as an absence of Ikka (OMIM Ref. No. 600664) phosphorylation activity. Prkcb -/- mice, lacking the Prkcb enzyme in lipid rafts after BCR stimulation, are also unable to recruit Ikka and Ikkb (OMIM Ref. No. 603258) to the rafts in B cells and have a reduced capacity to recruit other members of the BCR signalosome. However, Prkcb-deficient mice, unlike Xid mice, do have mature B cells expressing IgM and IgD, suggesting that the cells are maintained by an alternative Nfkb-activating pathway, e.g., through CD40 (OMIM Ref. No. 109535). Su et al. (2002) observed that specific Prkcb small molecule inhibitors block the survival of non-Hodgkin diffuse large B cell lymphoma (DLBCL) cell lines, with the effective dose depending on the level of cellular Prkcb. DLBCL lines not expressing Prkcb were not susceptible to the inhibitors. Su et al. (2002) proposed that PRKCB inhibitors and inhibitors of other PRKC isoforms may be effective in treating disorders

characterized by dysregulated NFKB survival signaling.

[72236] It is appreciated that the abovementioned animal model for PRKCB1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[72237] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[72238] Leitges, M.; Schmedt, C.; Guinamard, R.; Davoust, J.; Schaal, S.; Stabel, S.; Tarakhovsky, A. : Immunodeficiency in protein kinase C-beta-deficient mice. Science 273: 788-791, 1996. ; and

[72239] Su, T. T.; Guo, B.; Kawakami, Y.; Sommer, K.; Chae, K.; Humphries, L. A.; Kato, R. M.; Kang, S.; Patrone, L.; Wall, R.; Teitell, M.; Leitges, M.; Kawakami, T.; Rawlings, D. J. : PKC-beta.

[72240] Further studies establishing the function and utilities of PRKCB1 are found in John Hopkins OMIM database record ID 176970, and in sited publications numbered 154 and 1544-1546 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Calcium/calmodulin-dependent Protein Kinase (CaM kinase) II Gamma (CAMK2G, Accession XM_044349) is an-

other VGAM2065 host target gene. CAMK2G BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CAMK2G, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMK2G BINDING SITE, designated SEQ ID:34191, to the nucleotide sequence of VGAM2065 RNA, herein designated VGAM RNA, also designated SEQ ID:4776.

[72241] Another function of VGAM2065 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase (CaM kinase) II Gamma (CAMK2G, Accession XM_044349). Accordingly, utilities of VGAM2065 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMK2G. FLJ13769 (Accession NM_025012) is another VGAM2065 host target gene. FLJ13769 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13769, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13769 BINDING SITE, designated SEQ ID:24591, to the nucleotide sequence of VGAM2065 RNA,

herein designated VGAM RNA, also designated SEQ ID:4776.

[72242] Another function of VGAM2065 is therefore inhibition of FLJ13769 (Accession NM_025012). Accordingly, utilities of VGAM2065 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13769. FLJ13955 (Accession NM_024759) is another VGAM2065 host target gene. FLJ13955 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13955 BINDING SITE, designated SEQ ID:24109, to the nucleotide sequence of VGAM2065 RNA, herein designated VGAM RNA, also designated SEQ ID:4776.

[72243] Another function of VGAM2065 is therefore inhibition of FLJ13955 (Accession NM_024759). Accordingly, utilities of VGAM2065 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13955. FLJ13964 (Accession NM_032186) is another VGAM2065 host target gene. FLJ13964 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by FLJ13964, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13964 BINDING SITE, designated SEQ ID:25902, to the nucleotide sequence of VGAM2065 RNA, herein designated VGAM RNA, also designated SEQ ID:4776.

[72244] Another function of VGAM2065 is therefore inhibition of FLJ13964 (Accession NM_032186). Accordingly, utilities of VGAM2065 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13964. HEMK (Accession NM_016173) is another VGAM2065 host target gene. HEMK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HEMK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEMK BINDING SITE, designated SEQ ID:18266, to the nucleotide sequence of VGAM2065 RNA, herein designated VGAM RNA, also designated SEQ ID:4776.

[72245] Another function of VGAM2065 is therefore inhibition of HEMK (Accession NM_016173). Accordingly, utilities of

VGAM2065 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEMK. Heat Shock 90kDa Protein 1, Alpha-like 3 (HSPCAL3, Accession XM_084514) is another VGAM2065 host target gene. HSPCAL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSPCAL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPCAL3 BINDING SITE, designated SEQ ID:37618, to the nucleotide sequence of VGAM2065 RNA, herein designated VGAM RNA, also designated SEQ ID:4776.

[72246] Another function of VGAM2065 is therefore inhibition of Heat Shock 90kDa Protein 1, Alpha-like 3 (HSPCAL3, Accession XM_084514). Accordingly, utilities of VGAM2065 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPCAL3. KIAA0217 (Accession XM_040265) is another VGAM2065 host target gene. KIAA0217 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0217, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0217 BINDING SITE, designated SEQ ID:33279, to the nucleotide sequence of VGAM2065 RNA, herein designated VGAM RNA, also designated SEQ ID:4776.

[72247] Another function of VGAM2065 is therefore inhibition of KIAA0217 (Accession XM_040265). Accordingly, utilities of VGAM2065 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0217. Rpo1-2 (Accession NM_019014) is another VGAM2065 host target gene. Rpo1-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by Rpo1-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rpo1-2 BINDING SITE, designated SEQ ID:21097, to the nucleotide sequence of VGAM2065 RNA, herein designated VGAM RNA, also designated SEQ ID:4776.

[72248] Another function of VGAM2065 is therefore inhibition of Rpo1-2 (Accession NM_019014). Accordingly, utilities of VGAM2065 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

Rpo1-2. Trans-golgi Network Protein 2 (TGOLN2, Accession XM_034215) is another VGAM2065 host target gene. TGOLN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TGOLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGOLN2 BINDING SITE, designated SEQ ID:32023, to the nucleotide sequence of VGAM2065 RNA, herein designated VGAM RNA, also designated SEQ ID:4776.

[72249] Another function of VGAM2065 is therefore inhibition of Trans-golgi Network Protein 2 (TGOLN2, Accession XM_034215). Accordingly, utilities of VGAM2065 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGOLN2. LOC149844 (Accession XM_086675) is another VGAM2065 host target gene. LOC149844 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149844, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149844 BINDING SITE, desig-

nated SEQ ID:38821, to the nucleotide sequence of VGAM2065 RNA, herein designated VGAM RNA, also designated SEQ ID:4776.

[72250] Another function of VGAM2065 is therefore inhibition of LOC149844 (Accession XM_086675). Accordingly, utilities of VGAM2065 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149844. LOC157567 (Accession XM_088328) is another VGAM2065 host target gene. LOC157567 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157567, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157567 BINDING SITE, designated SEQ ID:39612, to the nucleotide sequence of VGAM2065 RNA, herein designated VGAM RNA, also designated SEQ ID:4776.

[72251] Another function of VGAM2065 is therefore inhibition of LOC157567 (Accession XM_088328). Accordingly, utilities of VGAM2065 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157567. LOC158219 (Accession XM_088514) is another VGAM2065 host target gene. LOC158219 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158219 BINDING SITE, designated SEQ ID:39762, to the nucleotide sequence of VGAM2065 RNA, herein designated VGAM RNA, also designated SEQ ID:4776.

[72252] Another function of VGAM2065 is therefore inhibition of LOC158219 (Accession XM_088514). Accordingly, utilities of VGAM2065 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158219. LOC170132 (Accession XM_093119) is another VGAM2065 host target gene. LOC170132 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC170132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170132 BINDING SITE, designated SEQ ID:40177, to the nucleotide sequence of VGAM2065 RNA, herein designated VGAM RNA, also designated SEQ ID:4776.

[72253] Another function of VGAM2065 is therefore inhibition of

LOC170132 (Accession XM_093119). Accordingly, utilities of VGAM2065 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170132. LOC203350 (Accession XM_117536) is another VGAM2065 host target gene. LOC203350 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203350 BINDING SITE, designated SEQ ID:43533, to the nucleotide sequence of VGAM2065 RNA, herein designated VGAM RNA, also designated SEQ ID:4776.

[72254] Another function of VGAM2065 is therefore inhibition of LOC203350 (Accession XM_117536). Accordingly, utilities of VGAM2065 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203350. LOC51313 (Accession NM_016613) is another VGAM2065 host target gene. LOC51313 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC51313 BINDING SITE, designated SEQ ID:18719, to the nucleotide sequence of VGAM2065 RNA, herein designated VGAM RNA, also designated SEQ ID:4776.

[72255] Another function of VGAM2065 is therefore inhibition of LOC51313 (Accession NM_016613). Accordingly, utilities of VGAM2065 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51313. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2066 (VGAM2066) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72256] VGAM2066 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2066 was detected is described hereinabove with reference to Figs. 1-8.

[72257] VGAM2066 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2066 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[72258] VGAM2066 gene encodes a VGAM2066 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2066 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2066 precursor RNA is designated SEQ ID:2052, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2052 is located at position 9912 relative to the genome of Ectromelia Virus.

[72259] VGAM2066 precursor RNA folds onto itself, forming VGAM2066 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72260] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2066 folded precursor RNA into VGAM2066 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2066 RNA is designated SEQ ID:4777, and is provided hereinbelow with reference to the sequence listing part.

[72261] VGAM2066 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2066 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2066 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72262] VGAM2066 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2066 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2066 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2066 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2066 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72263] The complementary binding of VGAM2066 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2066 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2066 host target RNA into VGAM2066 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72264] It is appreciated that VGAM2066 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2066 host target genes. The mRNA of each one of this plurality of VGAM2066 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2066 RNA, herein designated VGAM RNA, and which when bound by VGAM2066 RNA causes inhibition of translation of respective one or more VGAM2066 host target proteins.

[72265] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2066 gene, herein designated VGAM GENE, on one or more VGAM2066 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72266] It is yet further appreciated that a function of VGAM2066 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2066 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2066 correlate with, and may be deduced from, the identity of the host target genes which VGAM2066 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72267] Nucleotide sequences of the VGAM2066 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2066 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2066 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2066 are further described hereinbelow with reference to Table 1.

[72268] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2066 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2066 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72269] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2066 gene, herein designated VGAM is inhibition of expression of VGAM2066 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2066 correlate with, and may be deduced from, the identity of the target genes which VGAM2066 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72270] Brain and Acute Leukemia, Cytoplasmic (BAALC, Accession NM_024812) is a VGAM2066 host target gene. BAALC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BAALC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAALC BINDING SITE, designated SEQ ID:24198, to the nucleotide sequence of VGAM2066 RNA, herein designated VGAM RNA, also designated SEQ ID:4777.

[72271] A function of VGAM2066 is therefore inhibition of Brain and Acute Leukemia, Cytoplasmic (BAALC, Accession NM_024812). Accordingly, utilities of VGAM2066 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAALC. Ceramide Kinase (cerk, Accession NM_022766) is another VGAM2066 host target gene. cerk BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by cerk, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of cerk BINDING SITE, designated SEQ ID:23014, to the nucleotide sequence of VGAM2066 RNA, herein designated VGAM RNA, also designated SEQ ID:4777.

[72272] Another function of VGAM2066 is therefore inhibition of Ceramide Kinase (cerk, Accession NM_022766). Accordingly, utilities of VGAM2066 include diagnosis, prevention and treatment of diseases and clinical conditions associated with cerk. Dynein, Cytoplasmic, Light Intermediate Polypeptide 1 (DNCLI1, Accession XM_003119) is another VGAM2066 host target gene. DNCLI1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by DNCLI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNCLI1 BINDING SITE, designated SEQ ID:29929, to the nucleotide sequence of VGAM2066 RNA, herein designated VGAM RNA, also designated SEQ ID:4777.

[72273] Another function of VGAM2066 is therefore inhibition of Dynein, Cytoplasmic, Light Intermediate Polypeptide 1 (DNCLI1, Accession XM_003119). Accordingly, utilities of VGAM2066 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNCLI1. Histamine Receptor H4 (HRH4, Accession NM_021624) is another VGAM2066 host target gene. HRH4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HRH4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRH4 BINDING SITE, designated SEQ ID:22265, to the nucleotide sequence of VGAM2066 RNA, herein designated VGAM RNA, also designated SEQ ID:4777.

[72274] Another function of VGAM2066 is therefore inhibition of

Histamine Receptor H4 (HRH4, Accession NM_021624). Accordingly, utilities of VGAM2066 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRH4. KIAA0368 (Accession XM_036708) is another VGAM2066 host target gene. KIAA0368 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0368, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0368 BINDING SITE, designated SEQ ID:32491, to the nucleotide sequence of VGAM2066 RNA, herein designated VGAM RNA, also designated SEQ ID:4777.

[72275] Another function of VGAM2066 is therefore inhibition of KIAA0368 (Accession XM_036708). Accordingly, utilities of VGAM2066 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0368. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431) is another VGAM2066 host target gene. SEMA3E BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

SEMA3E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3E BINDING SITE, designated SEQ ID:14811, to the nucleotide sequence of VGAM2066 RNA, herein designated VGAM RNA, also designated SEQ ID:4777.

[72276] Another function of VGAM2066 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431). Accordingly, utilities of VGAM2066 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3E. LOC153139 (Accession XM_098318) is another VGAM2066 host target gene. LOC153139 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153139 BINDING SITE, designated SEQ ID:41575, to the nucleotide sequence of VGAM2066 RNA, herein designated VGAM RNA, also designated SEQ ID:4777.

[72277] Another function of VGAM2066 is therefore inhibition of LOC153139 (Accession XM_098318). Accordingly, utilities of VGAM2066 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153139. LOC154184 (Accession XM_098488) is another VGAM2066 host target gene. LOC154184 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC154184, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154184 BINDING SITE, designated SEQ ID:41687, to the nucleotide sequence of VGAM2066 RNA, herein designated VGAM RNA, also designated SEQ ID:4777.

[72278] Another function of VGAM2066 is therefore inhibition of LOC154184 (Accession XM_098488). Accordingly, utilities of VGAM2066 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154184. LOC221601 (Accession XM_168071) is another VGAM2066 host target gene. LOC221601 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221601, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221601 BINDING SITE, designated SEQ ID:44984, to the nucleotide sequence of VGAM2066 RNA, herein designated VGAM RNA, also designated SEQ ID:4777.

[72279] Another function of VGAM2066 is therefore inhibition of LOC221601 (Accession XM_168071). Accordingly, utilities of VGAM2066 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221601. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2067 (VGAM2067) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72280] VGAM2067 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2067 was detected is described hereinabove with reference to Figs. 1-8.

[72281] VGAM2067 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2067 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[72282] VGAM2067 gene encodes a VGAM2067 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2067 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2067 precursor RNA is designated SEQ ID:2053, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2053 is located at position 7556 relative to the genome of Ectromelia Virus.

[72283] VGAM2067 precursor RNA folds onto itself, forming VGAM2067 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72284] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2067 folded precursor RNA into VGAM2067

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2067 RNA is designated SEQ ID:4778, and is provided hereinbelow with reference to the sequence listing part.

[72285] VGAM2067 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2067 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2067 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72286] VGAM2067 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2067 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2067 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2067 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2067 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72287] The complementary binding of VGAM2067 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2067 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2067 host target RNA into VGAM2067 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[72288] It is appreciated that VGAM2067 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2067 host target genes. The mRNA of each one of this plurality of VGAM2067 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2067 RNA, herein designated VGAM RNA, and which when bound by VGAM2067 RNA causes inhibition of translation of respective one or more VGAM2067 host target proteins.

[72289] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2067 gene, herein designated VGAM GENE, on one or more VGAM2067 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72290] It is yet further appreciated that a function of VGAM2067 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2067 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2067 correlate with, and may be deduced from, the identity of the host target genes which VGAM2067 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72291] Nucleotide sequences of the VGAM2067 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2067 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2067 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2067 are further described hereinbelow with reference to Table 1.

[72292] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2067 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2067 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72293] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2067 gene, herein designated VGAM is inhibition of expression of VGAM2067 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2067 correlate with, and may be deduced from, the identity of the target genes which VGAM2067 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72294] KIAA1323 (Accession XM_032146) is a VGAM2067 host target gene. KIAA1323 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1323 BINDING SITE, designated SEQ ID:31571, to the nucleotide sequence of VGAM2067 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4778.

[72295] A function of VGAM2067 is therefore inhibition of KIAA1323 (Accession XM_032146). Accordingly, utilities of VGAM2067 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1323. MAP (Accession NM_022818) is another VGAM2067 host target gene. MAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP BINDING SITE, designated SEQ ID:23098, to the nucleotide sequence of VGAM2067 RNA, herein designated VGAM RNA, also designated SEQ ID:4778.

[72296] Another function of VGAM2067 is therefore inhibition of MAP (Accession NM_022818). Accordingly, utilities of VGAM2067 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP. PP1044 (Accession NM_021730) is another VGAM2067 host target gene. PP1044 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PP1044, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP1044 BINDING SITE, designated SEQ ID:22327, to the nucleotide sequence of VGAM2067 RNA, herein designated VGAM RNA, also designated SEQ ID:4778.

[72297] Another function of VGAM2067 is therefore inhibition of PP1044 (Accession NM_021730). Accordingly, utilities of VGAM2067 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1044. Signal-regulatory Protein Beta 1 (SIRPB1, Accession NM_006065) is another VGAM2067 host target gene. SIRPB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SIRPB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIRPB1 BINDING SITE, designated SEQ ID:12712, to the nucleotide sequence of VGAM2067 RNA, herein designated VGAM RNA, also designated SEQ ID:4778.

[72298] Another function of VGAM2067 is therefore inhibition of Signal-regulatory Protein Beta 1 (SIRPB1, Accession

NM_006065). Accordingly, utilities of VGAM2067 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIRPB1. LOC93496 (Accession XM_051698) is another VGAM2067 host target gene. LOC93496 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93496, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93496 BINDING SITE, designated SEQ ID:35867, to the nucleotide sequence of VGAM2067 RNA, herein designated VGAM RNA, also designated SEQ ID:4778.

[72299] Another function of VGAM2067 is therefore inhibition of LOC93496 (Accession XM_051698). Accordingly, utilities of VGAM2067 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93496. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2068 (VGAM2068) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[72300] VGAM2068 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2068 was detected is described hereinabove with reference to Figs. 1-8.

[72301] VGAM2068 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM2068 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72302] VGAM2068 gene encodes a VGAM2068 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2068 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2068 precursor RNA is designated SEQ ID:2054, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2054 is located at position 18952 relative to the genome of Monkeypox Virus.

[72303] VGAM2068 precursor RNA folds onto itself, forming VGAM2068 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72304] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2068 folded precursor RNA into VGAM2068 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2068 RNA is designated SEQ ID:4779, and is provided hereinbelow with reference to the sequence listing part.

[72305] VGAM2068 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2068 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2068 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72306] VGAM2068 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2068 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2068 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2068 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2068 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[72307] The complementary binding of VGAM2068 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2068 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2068 host target RNA into VGAM2068 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72308] It is appreciated that VGAM2068 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2068 host target genes. The mRNA of each one of this plurality of VGAM2068 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2068 RNA, herein designated VGAM RNA, and which when bound by VGAM2068 RNA causes inhibition of translation of respective one or more VGAM2068 host target proteins.

[72309] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2068 gene, herein designated VGAM GENE, on one

or more VGAM2068 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72310] It is yet further appreciated that a function of VGAM2068 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2068 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM2068 correlate with, and may be deduced from, the identity of the host target genes which VGAM2068 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72311] Nucleotide sequences of the VGAM2068 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2068 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2068 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2068 are further described hereinbelow with reference to Table 1.

[72312] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2068 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2068 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72313] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2068 gene, herein designated VGAM is inhibition of expression of VGAM2068 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2068 correlate with, and may be deduced from, the identity of the target genes which VGAM2068 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72314] ATP-binding Cassette, Sub-family B (MDR/TAP), Member

10 (ABCB10, Accession NM_012089) is a VGAM2068 host target gene. ABCB10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABCB10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCB10 BINDING SITE, designated SEQ ID:14373, to the nucleotide sequence of VGAM2068 RNA, herein designated VGAM RNA, also designated SEQ ID:4779.

[72315] A function of VGAM2068 is therefore inhibition of ATP-binding Cassette, Sub-family B (MDR/TAP), Member 10 (ABCB10, Accession NM_012089), a gene which a member of the superfamily of ATP-binding cassette (ABC) transporters. Accordingly, utilities of VGAM2068 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCB10. The function of ABCB10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1523.Protocadherin Alpha 9 (PCDHA9, Accession NM_014005) is another VGAM2068 host target gene. PCDHA9 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by PCDHA9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE, designated SEQ ID:15207, to the nucleotide sequence of VGAM2068 RNA, herein designated VGAM RNA, also designated SEQ ID:4779.

[72316] Another function of VGAM2068 is therefore inhibition of Protocadherin Alpha 9 (PCDHA9, Accession NM_014005), a gene which is a calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM2068 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA9. The function of PCDHA9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM71.Prostaglandin-endoperoxide Synthase 1 (prostaglandin G/H synthase and cyclooxygenase) (PTGS1, Accession NM_080591) is another VGAM2068 host target gene. PTGS1 BINDING SITE1 and PTGS1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTGS1, corresponding to HOST TAR-

GET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGS1 BINDING SITE1 and PTGS1 BINDING SITE2, designated SEQ ID:27898 and SEQ ID:6677 respectively, to the nucleotide sequence of VGAM2068 RNA, herein designated VGAM RNA, also designated SEQ ID:4779.

[72317] Another function of VGAM2068 is therefore inhibition of Prostaglandin-endoperoxide Synthase 1 (prostaglandin G/H synthase and cyclooxygenase) (PTGS1, Accession NM_080591), a gene which may play an important role in regulating or promoting cell proliferation in some normal and neoplastically transformed cells. Accordingly, utilities of VGAM2068 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGS1. The function of PTGS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1224.Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2069 (VGAM2069) viral gene, which modulates expression of respective host tar-

get genes thereof, the function and utility of which host target genes is known in the art.

[72318] VGAM2069 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2069 was detected is described hereinabove with reference to Figs. 1-8.

[72319] VGAM2069 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM2069 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72320] VGAM2069 gene encodes a VGAM2069 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2069 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2069 precursor RNA is designated SEQ ID:2055, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2055 is located at position 20862 relative to the genome of Monkeypox Virus.

[72321] VGAM2069 precursor RNA folds onto itself, forming VGAM2069 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72322] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2069 folded precursor RNA into VGAM2069 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2069 RNA is designated SEQ ID:4780, and is provided hereinbelow with reference to the sequence listing part.

[72323] VGAM2069 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2069 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2069 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72324] VGAM2069 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2069 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2069 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2069 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2069 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72325] The complementary binding of VGAM2069 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2069 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2069 host target RNA into VGAM2069 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72326] It is appreciated that VGAM2069 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2069 host target genes. The mRNA of each one of this plurality of VGAM2069 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2069 RNA, herein designated VGAM RNA, and which when bound by VGAM2069 RNA causes inhibition of translation of respective one or more VGAM2069 host target proteins.

[72327] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2069 gene, herein designated VGAM GENE, on one or more VGAM2069 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72328] It is yet further appreciated that a function of VGAM2069 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2069 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM2069 correlate with, and may be deduced from, the identity of the host target genes which VGAM2069 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[72329] Nucleotide sequences of the VGAM2069 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2069 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2069 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2069 are further described hereinbelow with reference to Table 1.

[72330] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2069 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2069 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72331] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2069 gene, herein designated VGAM is inhibition of expression of VGAM2069 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2069 correlate with, and may be deduced from, the identity of the target genes which VGAM2069 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72332] ATP-binding Cassette, Sub-family B (MDR/TAP), Member 10 (ABCB10, Accession NM_012089) is a VGAM2069 host target gene. ABCB10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABCB10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCB10 BINDING SITE, designated SEQ ID:14375, to the nucleotide sequence of VGAM2069 RNA, herein designated VGAM RNA, also designated SEQ ID:4780.

[72333] A function of VGAM2069 is therefore inhibition of ATP-binding Cassette, Sub-family B (MDR/TAP), Member 10 (ABCB10, Accession NM_012089), a gene which a member of the superfamily of ATP-binding cassette (ABC) transporters. Accordingly, utilities of VGAM2069 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCB10. The function of ABCB10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1523.Component of Oligomeric Golgi Complex 3 (COG3, Accession NM_031431) is another VGAM2069 host

target gene. COG3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COG3 BINDING SITE, designated SEQ ID:25425, to the nucleotide sequence of VGAM2069 RNA, herein designated VGAM RNA, also designated SEQ ID:4780.

[72334] Another function of VGAM2069 is therefore inhibition of Component of Oligomeric Golgi Complex 3 (COG3, Accession NM_031431), a gene which is critical for the structure and function of the Golgi apparatus. Accordingly, utilities of VGAM2069 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COG3. The function of COG3 has been established by previous studies. Multiprotein complexes are key determinants of Golgi apparatus structure and its capacity for intracellular transport and glycoprotein modification. Several complexes have been identified, including the Golgi transport complex (GTC), the LDLC complex, which is involved in glycosylation reactions, and the SEC34 complex, which is involved in vesicular transport. These 3 com-

plexes are identical and have been termed the conserved oligomeric Golgi (COG) complex, which includes COG3 (Ungar et al., 2002). By SDS-PAGE analysis of bovine brain cytosol, Ungar et al. (2002) identified the 8 subunits of the COG complex. Immunofluorescence microscopy demonstrated that COG1 (LDLB; 606973) colocalizes with COG7 (OMIM Ref. No. 606978), as well as with COG3 and COG5 (OMIM Ref. No. 606821), with a Golgi marker in a perinuclear distribution. Immunoprecipitation analysis showed that all COG subunits interact with COG2 (LDLC; 606974). Ungar et al. (2002) concluded that the COG complex is critical for the structure and function of the Golgi apparatus and can influence intracellular membrane trafficking

[72335] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[72336] Suvorova, E. S.; Kurten, R. C.; Lupashin, V. V. : Identification of a human orthologue of Sec34p as a component of the cis-Golgi vesicle tethering machinery. J. Biol. Chem. 276: 22810-22818, 2001. ; and

[72337] Ungar, D.; Oka, T.; Brittle, E. E.; Vasile, E.; Lupashin, V. V.; Chatterton, J. E.; Heuser, J. E.; Krieger, M.; Waters, M. G. :

Characterization of a mammalian Golgi-localized protein c.

[72338] Further studies establishing the function and utilities of COG3 are found in John Hopkins OMIM database record ID 606975, and in sited publications numbered 515 and 6340 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Dmx-like 1 (DMXL1, Accession NM_005509) is another VGAM2069 host target gene. DMXL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DMXL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMXL1 BINDING SITE, designated SEQ ID:12022, to the nucleotide sequence of VGAM2069 RNA, herein designated VGAM RNA, also designated SEQ ID:4780.

[72339] Another function of VGAM2069 is therefore inhibition of Dmx-like 1 (DMXL1, Accession NM_005509). Accordingly, utilities of VGAM2069 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMXL1. Growth Differentiation Factor 8 (GDF8, Accession NM_005259) is another VGAM2069 host target

gene. GDF8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GDF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GDF8 BINDING SITE, designated SEQ ID:11763, to the nucleotide sequence of VGAM2069 RNA, herein designated VGAM RNA, also designated SEQ ID:4780.

[72340] Another function of VGAM2069 is therefore inhibition of Growth Differentiation Factor 8 (GDF8, Accession NM_005259), a gene which acts specifically as a negative regulator of skeletal muscle growth. Accordingly, utilities of VGAM2069 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GDF8. The function of GDF8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM386.Alpha 1,4-galactosyltransferase (A4GALT, Accession NM_017436) is another VGAM2069 host target gene. A4GALT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by A4GALT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of A4GALT BINDING SITE, designated SEQ ID:18893, to the nucleotide sequence of VGAM2069 RNA, herein designated VGAM RNA, also designated SEQ ID:4780.

[72341] Another function of VGAM2069 is therefore inhibition of Alpha 1,4-galactosyltransferase (A4GALT, Accession NM_017436). Accordingly, utilities of VGAM2069 include diagnosis, prevention and treatment of diseases and clinical conditions associated with A4GALT. KIAA1317 (Accession XM_098368) is another VGAM2069 host target gene. KIAA1317 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1317 BINDING SITE, designated SEQ ID:41623, to the nucleotide sequence of VGAM2069 RNA, herein designated VGAM RNA, also designated SEQ ID:4780.

[72342] Another function of VGAM2069 is therefore inhibition of KIAA1317 (Accession XM_098368). Accordingly, utilities of VGAM2069 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1317. LOC114932 (Accession XM_052614) is another VGAM2069 host target gene. LOC114932 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC114932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC114932 BINDING SITE, designated SEQ ID:36003, to the nucleotide sequence of VGAM2069 RNA, herein designated VGAM RNA, also designated SEQ ID:4780.

[72343] Another function of VGAM2069 is therefore inhibition of LOC114932 (Accession XM_052614). Accordingly, utilities of VGAM2069 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC114932. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2070 (VGAM2070) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72344] VGAM2070 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2070 was detected is described hereinabove with reference to Figs. 1-8.

[72345] VGAM2070 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM2070 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72346] VGAM2070 gene encodes a VGAM2070 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2070 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2070 precursor RNA is designated SEQ ID:2056, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2056 is located at position 20302 relative to the genome of Monkeypox Virus.

[72347] VGAM2070 precursor RNA folds onto itself, forming VGAM2070 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72348] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2070 folded precursor RNA into VGAM2070 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2070 RNA is designated SEQ ID:4781, and is provided hereinbelow with reference to the sequence listing part.

[72349] VGAM2070 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2070 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2070 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72350] VGAM2070 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2070 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2070 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2070 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2070 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72351] The complementary binding of VGAM2070 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2070 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2070 host target RNA into VGAM2070 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72352] It is appreciated that VGAM2070 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2070 host target genes. The mRNA of each one of this plurality of VGAM2070 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2070 RNA, herein designated VGAM RNA, and which when bound by VGAM2070 RNA causes inhibition of translation of respective one or more VGAM2070 host target proteins.

[72353] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2070 gene, herein designated VGAM GENE, on one or more VGAM2070 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72354] It is yet further appreciated that a function of VGAM2070 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2070 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM2070 correlate with, and may be deduced from, the identity of the host target genes which VGAM2070 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72355] Nucleotide sequences of the VGAM2070 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2070 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2070 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2070 are further described hereinbelow with reference to Table 1.

[72356] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2070 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2070 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72357] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2070 gene, herein designated VGAM is inhibition of expression of VGAM2070 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2070 correlate with, and may be deduced from, the identity of the target genes which VGAM2070 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72358] Lipoprotein Lipase (LPL, Accession NM_000237) is a VGAM2070 host target gene. LPL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by LPL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPL BINDING SITE, designated SEQ ID:5751, to the nucleotide sequence of VGAM2070 RNA, herein designated VGAM RNA, also designated SEQ ID:4781.

[72359] A function of VGAM2070 is therefore inhibition of Lipoprotein Lipase (LPL, Accession NM_000237), a gene which is the hydrolysis of triglycerides of circulating chylomicrons and very low density lipoproteins (vldl). the enzyme functions in the presence of apolipoprotein c-2 on the luminal surface of vascular. Accordingly, utilities of VGAM2070 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPL. The function of LPL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.FLJ14624 (Accession XM_049060) is another VGAM2070 host target gene. FLJ14624 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14624, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14624 BINDING SITE, designated SEQ ID:35336, to the nucleotide sequence of VGAM2070 RNA, herein designated VGAM RNA, also designated SEQ ID:4781.

[72360] Another function of VGAM2070 is therefore inhibition of FLJ14624 (Accession XM_049060). Accordingly, utilities of VGAM2070 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14624. Glutamate Receptor, Ionotropic, Delta 1 (GRID1, Accession XM_043613) is another VGAM2070 host target gene. GRID1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRID1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRID1 BINDING SITE, designated SEQ ID:33981, to the nucleotide sequence of VGAM2070 RNA, herein designated VGAM RNA, also designated SEQ ID:4781.

[72361] Another function of VGAM2070 is therefore inhibition of Glutamate Receptor, Ionotropic, Delta 1 (GRID1, Accession XM_043613). Accordingly, utilities of VGAM2070 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with GRID1. KIAA1336 (Accession XM_051306) is another VGAM2070 host target gene. KIAA1336 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1336 BINDING SITE, designated SEQ ID:35803, to the nucleotide sequence of VGAM2070 RNA, herein designated VGAM RNA, also designated SEQ ID:4781.

[72362] Another function of VGAM2070 is therefore inhibition of KIAA1336 (Accession XM_051306). Accordingly, utilities of VGAM2070 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1336. STRIN (Accession NM_016271) is another VGAM2070 host target gene. STRIN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STRIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STRIN BINDING SITE,

designated SEQ ID:18397, to the nucleotide sequence of VGAM2070 RNA, herein designated VGAM RNA, also designated SEQ ID:4781.

[72363] Another function of VGAM2070 is therefore inhibition of STRIN (Accession NM_016271). Accordingly, utilities of VGAM2070 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STRIN. LOC158314 (Accession XM_098920) is another VGAM2070 host target gene. LOC158314 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158314, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158314 BINDING SITE, designated SEQ ID:41953, to the nucleotide sequence of VGAM2070 RNA, herein designated VGAM RNA, also designated SEQ ID:4781.

[72364] Another function of VGAM2070 is therefore inhibition of LOC158314 (Accession XM_098920). Accordingly, utilities of VGAM2070 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158314. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2071 (VGAM2071) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72365] VGAM2071 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2071 was detected is described hereinabove with reference to Figs. 1-8.

[72366] VGAM2071 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM2071 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72367] VGAM2071 gene encodes a VGAM2071 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2071 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2071 precursor RNA is designated SEQ ID:2057, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2057 is located at position 28091 relative to the genome of Monkeypox Virus.

[72368] VGAM2071 precursor RNA folds onto itself, forming VGAM2071 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72369] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2071 folded precursor RNA into VGAM2071 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM2071 RNA is designated SEQ ID:4782, and is provided hereinbelow with reference to the sequence listing part.

[72370] VGAM2071 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2071 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2071 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[72371] VGAM2071 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2071 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2071 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2071 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2071 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72372] The complementary binding of VGAM2071 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2071 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2071 host target RNA into VGAM2071 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72373] It is appreciated that VGAM2071 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2071 host target genes. The mRNA of each one of this plurality of VGAM2071 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2071 RNA, herein designated VGAM RNA, and which when bound by VGAM2071 RNA causes inhibition of translation of respective one or more VGAM2071 host target proteins.

[72374] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2071 gene, herein designated VGAM GENE, on one or more VGAM2071 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72375] It is yet further appreciated that a function of VGAM2071 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM2071 correlate with, and may be deduced from, the identity of the host target genes which VGAM2071 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72376] Nucleotide sequences of the VGAM2071 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2071 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2071 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2071 are further described hereinbelow with reference to Table 1.

[72377] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2071 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2071 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72378] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2071 gene, herein designated VGAM is inhibition of expression of VGAM2071 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2071 correlate with, and may be deduced from, the identity of the target genes which VGAM2071 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72379] Adenosine Deaminase, RNA-specific (ADAR, Accession NM_001111) is a VGAM2071 host target gene. ADAR

BINDING SITE1 through ADAR BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADAR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAR BINDING SITE1 through ADAR BINDING SITE3, designated SEQ ID:6771, SEQ ID:17957 and SEQ ID:17964 respectively, to the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA, also designated SEQ ID:4782.

[72380] A function of VGAM2071 is therefore inhibition of Adenosine Deaminase, RNA-specific (ADAR, Accession NM_001111), a gene which converts adenosine to inosine in double-stranded RNA. Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAR. The function of ADAR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM323.Endometrial Bleeding Associated Factor (left-right determination, factor A; transforming growth factor beta superfamily) (EBAF, Accession XM_037302) is another VGAM2071 host target gene. EBAF BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EBAF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EBAF BINDING SITE, designated SEQ ID:32606, to the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA, also designated SEQ ID:4782.

[72381] Another function of VGAM2071 is therefore inhibition of Endometrial Bleeding Associated Factor (left-right determination, factor A; transforming growth factor beta superfamily) (EBAF, Accession XM_037302), a gene which LEFT-RIGHT AXIS MALFORMATIONS. Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EBAF. The function of EBAF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM93.Gap Junction Protein, Beta 1, 32kDa (connexin 32, Charcot-Marie-Tooth neuropathy, X-linked) (GJB1, Accession XM_010141) is another VGAM2071 host target gene. GJB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by GJB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GJB1 BINDING SITE, designated SEQ ID:30129, to the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA, also designated SEQ ID:4782.

[72382] Another function of VGAM2071 is therefore inhibition of Gap Junction Protein, Beta 1, 32kDa (connexin 32, Charcot-Marie-Tooth neuropathy, X-linked) (GJB1, Accession XM_010141). Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GJB1. Hippocalcin-like 1 (HPCAL1, Accession NM_134421) is another VGAM2071 host target gene. HPCAL1 BINDING SITE1 and HPCAL1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HPCAL1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPCAL1 BINDING SITE1 and HPCAL1 BINDING SITE2, designated SEQ ID:28637 and SEQ ID:7930 respectively, to the nucleotide sequence of VGAM2071 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4782.

[72383] Another function of VGAM2071 is therefore inhibition of Hippocalcin-like 1 (HPCAL1, Accession NM_134421). Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPCAL1. Interleukin 2 Receptor, Alpha (IL2RA, Accession NM_000417) is another VGAM2071 host target gene. IL2RA BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IL2RA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL2RA BINDING SITE, designated SEQ ID:5999, to the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA, also designated SEQ ID:4782.

[72384] Another function of VGAM2071 is therefore inhibition of Interleukin 2 Receptor, Alpha (IL2RA, Accession NM_000417), a gene which plays a role in T cell mediated immune response. Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL2RA. The function of IL2RA and its association with various diseases and clini-

cal conditions, has been established by previous studies, as described hereinabove with reference to VGAM1168.Meis1, Myeloid Ecotropic Viral Integration Site 1 Homolog (mouse) (MEIS1, Accession NM_002398) is another VGAM2071 host target gene. MEIS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MEIS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEIS1 BINDING SITE, designated SEQ ID:8217, to the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA, also designated SEQ ID:4782.

[72385] Another function of VGAM2071 is therefore inhibition of Meis1, Myeloid Ecotropic Viral Integration Site 1 Homolog (mouse) (MEIS1, Accession NM_002398), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEIS1. The function of MEIS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM894.NPR2L

(Accession NM_006545) is another VGAM2071 host target gene. NPR2L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NPR2L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPR2L BINDING SITE, designated SEQ ID:13299, to the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA, also designated SEQ ID:4782.

[72386] Another function of VGAM2071 is therefore inhibition of NPR2L (Accession NM_006545). Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPR2L. Poliovirus Receptor (PVR, Accession NM_006505) is another VGAM2071 host target gene. PVR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PVR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PVR BINDING SITE, designated SEQ ID:13254, to the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA,

also designated SEQ ID:4782.

[72387] Another function of VGAM2071 is therefore inhibition of Poliovirus Receptor (PVR, Accession NM_006505), a gene which is a poliovirus receptor. Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PVR. The function of PVR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1411.Tight Junction Protein 1 (zona occludens 1) (TJP1, Accession NM_003257) is another VGAM2071 host target gene. TJP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TJP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TJP1 BINDING SITE, designated SEQ ID:9262, to the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA, also designated SEQ ID:4782.

[72388] Another function of VGAM2071 is therefore inhibition of Tight Junction Protein 1 (zona occludens 1) (TJP1, Accession NM_003257), a gene which colocalizes and interacts with cadherins in cells lacking tight junctions. Accord-

ingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TJP1. The function of TJP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95.Chromosome X Open Reading Frame 1 (CXorf1, Accession NM_004709) is another VGAM2071 host target gene. CXorf1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CXorf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXorf1 BINDING SITE, designated SEQ ID:11054, to the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA, also designated SEQ ID:4782.

[72389] Another function of VGAM2071 is therefore inhibition of Chromosome X Open Reading Frame 1 (CXorf1, Accession NM_004709). Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXorf1. DKFZP434K1772 (Accession XM_041936) is another VGAM2071 host target gene. DKFZP434K1772 BINDING SITE is HOST TARGET

binding site found in the 5` untranslated region of mRNA encoded by DKFZP434K1772, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434K1772 BINDING SITE, designated SEQ ID:33629, to the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA, also designated SEQ ID:4782.

[72390] Another function of VGAM2071 is therefore inhibition of DKFZP434K1772 (Accession XM_041936). Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434K1772. DKFZp547D155 (Accession XM_046977) is another VGAM2071 host target gene. DKFZp547D155 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp547D155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547D155 BINDING SITE, designated SEQ ID:34867, to the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA, also designated SEQ ID:4782.

[72391] Another function of VGAM2071 is therefore inhibition of DKFZp547D155 (Accession XM_046977). Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547D155. FLJ12242 (Accession NM_024681) is another VGAM2071 host target gene. FLJ12242 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12242 BINDING SITE, designated SEQ ID:23994, to the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA, also designated SEQ ID:4782.

[72392] Another function of VGAM2071 is therefore inhibition of FLJ12242 (Accession NM_024681). Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12242. FLJ12387 (Accession NM_022822) is another VGAM2071 host target gene. FLJ12387 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12387 BINDING SITE, designated SEQ ID:23100, to the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA, also designated SEQ ID:4782.

[72393] Another function of VGAM2071 is therefore inhibition of FLJ12387 (Accession NM_022822). Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12387. FLJ12975 (Accession XM_045522) is another VGAM2071 host target gene. FLJ12975 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12975, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12975 BINDING SITE, designated SEQ ID:34479, to the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA, also designated SEQ ID:4782.

[72394] Another function of VGAM2071 is therefore inhibition of FLJ12975 (Accession XM_045522). Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ12975. KIAA0155 (Accession NM_014633) is another VGAM2071 host target gene. KIAA0155 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0155 BINDING SITE, designated SEQ ID:16002, to the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA, also designated SEQ ID:4782.

[72395] Another function of VGAM2071 is therefore inhibition of KIAA0155 (Accession NM_014633). Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0155. KIAA1649 (Accession NM_032311) is another VGAM2071 host target gene. KIAA1649 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1649 BINDING SITE, designated SEQ ID:26104, to the nucleotide sequence of VGAM2071 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4782.

[72396] Another function of VGAM2071 is therefore inhibition of KIAA1649 (Accession NM_032311). Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1649. PRO0899 (Accession NM_018565) is another VGAM2071 host target gene. PRO0899 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0899, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0899 BINDING SITE, designated SEQ ID:20648, to the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA, also designated SEQ ID:4782.

[72397] Another function of VGAM2071 is therefore inhibition of PRO0899 (Accession NM_018565). Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0899. Translocation Protein 1 (TLOC1, Accession NM_003262) is another VGAM2071 host target gene. TLOC1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by

TLOC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TLOC1 BINDING SITE, designated SEQ ID:9272, to the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA, also designated SEQ ID:4782.

[72398] Another function of VGAM2071 is therefore inhibition of Translocation Protein 1 (TLOC1, Accession NM_003262). Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLOC1. LOC151877 (Accession XM_098132) is another VGAM2071 host target gene. LOC151877 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151877 BINDING SITE, designated SEQ ID:41394, to the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA, also designated SEQ ID:4782.

[72399] Another function of VGAM2071 is therefore inhibition of

LOC151877 (Accession XM_098132). Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151877. LOC152179 (Accession XM_098170) is another VGAM2071 host target gene. LOC152179 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152179 BINDING SITE, designated SEQ ID:41432, to the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA, also designated SEQ ID:4782.

[72400] Another function of VGAM2071 is therefore inhibition of LOC152179 (Accession XM_098170). Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152179. LOC164714 (Accession XM_104657) is another VGAM2071 host target gene. LOC164714 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC164714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC164714 BINDING SITE, designated SEQ ID:42176, to the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA, also designated SEQ ID:4782.

[72401] Another function of VGAM2071 is therefore inhibition of LOC164714 (Accession XM_104657). Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164714. LOC253783 (Accession XM_170873) is another VGAM2071 host target gene. LOC253783 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253783, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253783 BINDING SITE, designated SEQ ID:45641, to the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA, also designated SEQ ID:4782.

[72402] Another function of VGAM2071 is therefore inhibition of LOC253783 (Accession XM_170873). Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253783. LOC93166 (Accession XM_049619) is an-

other VGAM2071 host target gene. LOC93166 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93166 BINDING SITE, designated SEQ ID:35460, to the nucleotide sequence of VGAM2071 RNA, herein designated VGAM RNA, also designated SEQ ID:4782.

[72403] Another function of VGAM2071 is therefore inhibition of LOC93166 (Accession XM_049619). Accordingly, utilities of VGAM2071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93166. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2072 (VGAM2072) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72404] VGAM2072 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2072 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[72405] VGAM2072 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2072 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72406] VGAM2072 gene encodes a VGAM2072 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2072 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2072 precursor RNA is designated SEQ ID:2058, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2058 is located at position 23821 relative to the genome of Ectromelia Virus.

[72407] VGAM2072 precursor RNA folds onto itself, forming VGAM2072 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72408] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2072 folded precursor RNA into VGAM2072 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM2072 RNA is designated SEQ ID:4783, and is provided hereinbelow with reference to the sequence listing part.

[72409] VGAM2072 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2072 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2072 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72410] VGAM2072 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2072 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2072 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2072 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2072 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72411] The complementary binding of VGAM2072 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2072 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2072 host target RNA into VGAM2072 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72412] It is appreciated that VGAM2072 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2072 host target genes. The mRNA of each one of this plurality of VGAM2072 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2072 RNA, herein designated VGAM RNA, and which when bound by VGAM2072 RNA causes inhibition of translation of respective one or more VGAM2072 host target proteins.

[72413] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2072 gene, herein designated VGAM GENE, on one or more VGAM2072 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72414] It is yet further appreciated that a function of VGAM2072 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2072 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2072 correlate with, and may be deduced from, the identity of the host target genes which VGAM2072 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72415] Nucleotide sequences of the VGAM2072 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2072 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2072 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2072 are further described hereinbelow with reference to Table 1.

[72416] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2072 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2072 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72417] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2072 gene, herein designated VGAM is inhibition of expression of VGAM2072 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2072 correlate with, and may be deduced from, the identity of the target genes which VGAM2072 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72418] Collagen, Type XVII, Alpha 1 (COL17A1, Accession NM_000494) is a VGAM2072 host target gene. COL17A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COL17A1, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL17A1 BINDING SITE, designated SEQ ID:6106, to the nucleotide sequence of VGAM2072 RNA, herein designated VGAM RNA, also designated SEQ ID:4783.

[72419] A function of VGAM2072 is therefore inhibition of Collagen, Type XVII, Alpha 1 (COL17A1, Accession NM_000494). Accordingly, utilities of VGAM2072 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL17A1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2073 (VGAM2073) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72420] VGAM2073 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2073 was detected is described hereinabove with reference to Figs. 1-8.

[72421] VGAM2073 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus.

VGAM2073 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72422] VGAM2073 gene encodes a VGAM2073 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2073 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2073 precursor RNA is designated SEQ ID:2059, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2059 is located at position 16020 relative to the genome of Monkeypox Virus.

[72423] VGAM2073 precursor RNA folds onto itself, forming VGAM2073 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72424] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2073 folded precursor RNA into VGAM2073 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2073 RNA is designated SEQ ID:4784, and is provided hereinbelow with reference to the sequence listing part.

[72425] VGAM2073 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2073 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2073 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72426] VGAM2073 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2073 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2073 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2073 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2073 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72427] The complementary binding of VGAM2073 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2073 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2073 host target RNA into VGAM2073 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72428] It is appreciated that VGAM2073 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2073 host target genes. The mRNA of each one of this plurality of VGAM2073 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2073 RNA, herein designated VGAM RNA, and which when bound by VGAM2073 RNA causes inhibition of translation of respective one or more VGAM2073 host target proteins.

[72429] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2073 gene, herein designated VGAM GENE, on one or more VGAM2073 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72430] It is yet further appreciated that a function of VGAM2073 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2073 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM2073 correlate with, and may be deduced from, the identity of the host target genes which VGAM2073 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72431] Nucleotide sequences of the VGAM2073 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2073 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2073 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2073 are further described hereinbelow with reference to Table 1.

[72432] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2073 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2073 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72433] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2073 gene, herein designated VGAM is inhibition of expression of VGAM2073 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2073 correlate with, and may be deduced from, the identity of the target genes which VGAM2073 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72434] Chromosome 20 Open Reading Frame 98 (C20orf98, Accession XM_049398) is a VGAM2073 host target gene. C20orf98 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf98, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf98 BINDING SITE, designated SEQ

ID:35415, to the nucleotide sequence of VGAM2073 RNA, herein designated VGAM RNA, also designated SEQ ID:4784.

[72435] A function of VGAM2073 is therefore inhibition of Chromosome 20 Open Reading Frame 98 (C20orf98, Accession XM_049398). Accordingly, utilities of VGAM2073 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf98. Potassium Channel, Subfamily V, Member 1 (KCNV1, Accession NM_014379) is another VGAM2073 host target gene. KCNV1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCNV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNV1 BINDING SITE, designated SEQ ID:15710, to the nucleotide sequence of VGAM2073 RNA, herein designated VGAM RNA, also designated SEQ ID:4784.

[72436] Another function of VGAM2073 is therefore inhibition of Potassium Channel, Subfamily V, Member 1 (KCNV1, Accession NM_014379). Accordingly, utilities of VGAM2073 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with KCNV1. KIAA0087 (Accession NM_014769) is another VGAM2073 host target gene. KIAA0087 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0087, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0087 BINDING SITE, designated SEQ ID:16562, to the nucleotide sequence of VGAM2073 RNA, herein designated VGAM RNA, also designated SEQ ID:4784.

[72437] Another function of VGAM2073 is therefore inhibition of KIAA0087 (Accession NM_014769). Accordingly, utilities of VGAM2073 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0087. KIAA1877 (Accession XM_038616) is another VGAM2073 host target gene. KIAA1877 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1877 BINDING SITE, designated SEQ ID:32879, to the

nucleotide sequence of VGAM2073 RNA, herein designated VGAM RNA, also designated SEQ ID:4784.

[72438] Another function of VGAM2073 is therefore inhibition of KIAA1877 (Accession XM_038616). Accordingly, utilities of VGAM2073 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1877. MGC4643 (Accession NM_032715) is another VGAM2073 host target gene. MGC4643 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4643, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4643 BINDING SITE, designated SEQ ID:26441, to the nucleotide sequence of VGAM2073 RNA, herein designated VGAM RNA, also designated SEQ ID:4784.

[72439] Another function of VGAM2073 is therefore inhibition of MGC4643 (Accession NM_032715). Accordingly, utilities of VGAM2073 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4643. LOC219818 (Accession XM_165589) is another VGAM2073 host target gene. LOC219818 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by LOC219818, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219818 BINDING SITE, designated SEQ ID:43698, to the nucleotide sequence of VGAM2073 RNA, herein designated VGAM RNA, also designated SEQ ID:4784.

[72440] Another function of VGAM2073 is therefore inhibition of LOC219818 (Accession XM_165589). Accordingly, utilities of VGAM2073 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219818. LOC254219 (Accession XM_172913) is another VGAM2073 host target gene. LOC254219 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254219 BINDING SITE, designated SEQ ID:46173, to the nucleotide sequence of VGAM2073 RNA, herein designated VGAM RNA, also designated SEQ ID:4784.

[72441] Another function of VGAM2073 is therefore inhibition of LOC254219 (Accession XM_172913). Accordingly, utilities

of VGAM2073 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254219. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2074 (VGAM2074) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72442] VGAM2074 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2074 was detected is described hereinabove with reference to Figs. 1-8.

[72443] VGAM2074 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM2074 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72444] VGAM2074 gene encodes a VGAM2074 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2074 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2074 precursor RNA is designated SEQ ID:2060, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2060 is located at position 25479 relative to the genome of Monkeypox Virus.

[72445] VGAM2074 precursor RNA folds onto itself, forming VGAM2074 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72446] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2074 folded precursor RNA into VGAM2074 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2074 RNA is designated SEQ ID:4785, and

is provided hereinbelow with reference to the sequence listing part.

[72447] VGAM2074 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2074 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2074 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72448] VGAM2074 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2074 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2074 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2074 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2074 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72449] The complementary binding of VGAM2074 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2074 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2074 host target RNA into VGAM2074 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72450] It is appreciated that VGAM2074 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2074 host target genes. The mRNA of each one of this plurality of VGAM2074 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2074 RNA, herein designated VGAM RNA, and which when bound by VGAM2074 RNA causes inhibition of translation of respective one or more VGAM2074 host target proteins.

[72451] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2074 gene, herein designated VGAM GENE, on one or more VGAM2074 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72452] It is yet further appreciated that a function of VGAM2074 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2074 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM2074 correlate with, and may be deduced from, the identity of the host target genes which VGAM2074 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72453] Nucleotide sequences of the VGAM2074 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2074 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2074 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2074 are further described hereinbelow with reference to Table 1.

[72454] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2074 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2074 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72455] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2074 gene, herein designated VGAM is inhibition of expression of VGAM2074 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2074 correlate with, and may be deduced from, the identity of the target genes which VGAM2074 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72456] FLJ22405 (Accession NM_022485) is a VGAM2074 host target gene. FLJ22405 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22405, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22405 BINDING SITE, designated SEQ ID:22864, to the nucleotide sequence of VGAM2074 RNA, herein designated VGAM RNA, also designated SEQ ID:4785.

[72457] A function of VGAM2074 is therefore inhibition of FLJ22405 (Accession NM_022485). Accordingly, utilities of VGAM2074 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22405. KIAA1143 (Accession XM_044014) is another VGAM2074 host target gene. KIAA1143 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1143 BINDING SITE, designated SEQ ID:34078, to the nucleotide sequence of VGAM2074 RNA, herein designated VGAM RNA, also designated SEQ ID:4785.

[72458] Another function of VGAM2074 is therefore inhibition of KIAA1143 (Accession XM_044014). Accordingly, utilities of VGAM2074 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1143. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2075 (VGAM2075) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72459] VGAM2075 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2075 was detected is described hereinabove with reference to Figs. 1-8.

[72460] VGAM2075 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM2075 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72461] VGAM2075 gene encodes a VGAM2075 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2075 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2075 precursor RNA is designated SEQ ID:2061, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2061 is located at position 177494 relative to the genome of Variola Virus.

[72462] VGAM2075 precursor RNA folds onto itself, forming VGAM2075 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[72463] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2075 folded precursor RNA into VGAM2075 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2075 RNA is designated SEQ ID:4786, and is provided hereinbelow with reference to the sequence listing part.

[72464] VGAM2075 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2075 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2075 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72465] VGAM2075 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2075 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2075 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2075 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2075 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72466] The complementary binding of VGAM2075 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2075 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2075 host target RNA into VGAM2075 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72467] It is appreciated that VGAM2075 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2075 host target genes. The mRNA of each one of this plurality of VGAM2075 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2075 RNA, herein designated VGAM RNA, and which when bound by VGAM2075 RNA causes inhibition of translation of respective one or more VGAM2075 host target proteins.

[72468] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2075 gene, herein designated VGAM GENE, on one or more VGAM2075 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72469] It is yet further appreciated that a function of VGAM2075 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM2075 correlate with, and may be deduced from, the identity of the host target genes which VGAM2075 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72470] Nucleotide sequences of the VGAM2075 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2075 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2075 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2075 are further described hereinbelow with reference to Table 1.

[72471] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2075 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2075 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72472] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2075 gene, herein designated VGAM is inhibition of expression of VGAM2075 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2075 correlate with, and may be deduced from, the identity of the target genes which VGAM2075 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72473] Estrogen-related Receptor Gamma (ESRRG, Accession XM_039053) is a VGAM2075 host target gene. ESRRG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ESRRG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of ESRRG BINDING SITE, designated SEQ ID:32999, to the nucleotide sequence of VGAM2075 RNA, herein designated VGAM RNA, also designated SEQ ID:4786.

[72474] A function of VGAM2075 is therefore inhibition of Estrogen-related Receptor Gamma (ESRRG, Accession XM_039053), a gene which Estrogen-related receptor gamma. Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESRRG. The function of ESRRG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM359.Integrin, Alpha L (antigen CD11A (p180), Lymphocyte Function-associated Antigen 1; Alpha Polypeptide) (ITGAL, Accession NM_002209) is another VGAM2075 host target gene. ITGAL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGAL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGAL BINDING SITE, designated SEQ ID:7972, to the nucleotide sequence of VGAM2075 RNA, herein

designated VGAM RNA, also designated SEQ ID:4786.

[72475] Another function of VGAM2075 is therefore inhibition of Integrin, Alpha L (antigen CD11A (p180), Lymphocyte Function-associated Antigen 1; Alpha Polypeptide) (ITGAL, Accession NM_002209), a gene which s a receptor for icam1, icam2, icam3 and icam4. it is involved in a variety of immune phenomena including leukocyte-endothelial cell interaction, cytotoxic t-cell mediated killing, and antibody dependent killing by granulocytes and monocytes. Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGAL. The function of ITGAL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.Nuclear Fragile X Mental Retardation Protein Interacting Protein 1 (NUFIP1, Accession NM_012345) is another VGAM2075 host target gene. NUFIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NUFIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUFIP1 BINDING SITE, designated SEQ

ID:14737, to the nucleotide sequence of VGAM2075 RNA, herein designated VGAM RNA, also designated SEQ ID:4786.

[72476] Another function of VGAM2075 is therefore inhibition of Nuclear Fragile X Mental Retardation Protein Interacting Protein 1 (NUFIP1, Accession NM_012345), a gene which binds and colocalizes with nuclear fragile X mental retardation protein. Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUFIP1. The function of NUFIP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM733.POU Domain, Class 2, Associating Factor 1 (POU2AF1, Accession NM_006235) is another VGAM2075 host target gene. POU2AF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POU2AF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POU2AF1 BINDING SITE, designated SEQ ID:12892, to the nucleotide sequence of VGAM2075 RNA, herein designated VGAM RNA, also designated SEQ

ID:4786.

[72477] Another function of VGAM2075 is therefore inhibition of POU Domain, Class 2, Associating Factor 1 (POU2AF1, Accession NM_006235), a gene which is a transcriptional coactivator that specifically associates with either oct1 or oct2. Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU2AF1. The function of POU2AF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM171.Recombination Activating Gene 2 (RAG2, Accession XM_089839) is another VGAM2075 host target gene. RAG2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RAG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAG2 BINDING SITE, designated SEQ ID:39985, to the nucleotide sequence of VGAM2075 RNA, herein designated VGAM RNA, also designated SEQ ID:4786.

[72478] Another function of VGAM2075 is therefore inhibition of Recombination Activating Gene 2 (RAG2, Accession

XM_089839). Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAG2. Tensin (TNS, Accession NM_022648) is another VGAM2075 host target gene. TNS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNS BINDING SITE, designated SEQ ID:22903, to the nucleotide sequence of VGAM2075 RNA, herein designated VGAM RNA, also designated SEQ ID:4786.

[72479] Another function of VGAM2075 is therefore inhibition of Tensin (TNS, Accession NM_022648). Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNS. DKFZP434I092 (Accession XM_042042) is another VGAM2075 host target gene. DKFZP434I092 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434I092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DK-

FZP434I092 BINDING SITE, designated SEQ ID:33673, to the nucleotide sequence of VGAM2075 RNA, herein designated VGAM RNA, also designated SEQ ID:4786.

[72480] Another function of VGAM2075 is therefore inhibition of DKFZP434I092 (Accession XM_042042). Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434I092. FLJ10656 (Accession NM_018170) is another VGAM2075 host target gene. FLJ10656 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10656 BINDING SITE, designated SEQ ID:19988, to the nucleotide sequence of VGAM2075 RNA, herein designated VGAM RNA, also designated SEQ ID:4786.

[72481] Another function of VGAM2075 is therefore inhibition of FLJ10656 (Accession NM_018170). Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10656. GABA(A) Receptor-associated Protein Like 1 (GABARAPL1, Accession NM_031412) is another

VGAM2075 host target gene. GABARAPL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GABARAPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABARAPL1 BINDING SITE, designated SEQ ID:25392, to the nucleotide sequence of VGAM2075 RNA, herein designated VGAM RNA, also designated SEQ ID:4786.

[72482] Another function of VGAM2075 is therefore inhibition of GABA(A) Receptor-associated Protein Like 1 (GABARAPL1, Accession NM_031412). Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABARAPL1. GABA(A) Receptors Associated Protein Like 3 (GABARAPL3, Accession NM_032568) is another VGAM2075 host target gene. GABARAPL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GABARAPL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABARAPL3 BINDING SITE, designated SEQ ID:26300, to

the nucleotide sequence of VGAM2075 RNA, herein designated VGAM RNA, also designated SEQ ID:4786.

[72483] Another function of VGAM2075 is therefore inhibition of GABA(A) Receptors Associated Protein Like 3 (GABARAPL3, Accession NM_032568). Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABARAPL3. HT002 (Accession NM_014066) is another VGAM2075 host target gene. HT002 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HT002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HT002 BINDING SITE, designated SEQ ID:15281, to the nucleotide sequence of VGAM2075 RNA, herein designated VGAM RNA, also designated SEQ ID:4786.

[72484] Another function of VGAM2075 is therefore inhibition of HT002 (Accession NM_014066). Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HT002. KIAA0475 (Accession NM_014864) is another VGAM2075 host target gene. KIAA0475 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:16949, to the nucleotide sequence of VGAM2075 RNA, herein designated VGAM RNA, also designated SEQ ID:4786.

[72485] Another function of VGAM2075 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. KIAA0712 (Accession NM_014715) is another VGAM2075 host target gene. KIAA0712 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0712, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0712 BINDING SITE, designated SEQ ID:16262, to the nucleotide sequence of VGAM2075 RNA, herein designated VGAM RNA, also designated SEQ ID:4786.

[72486] Another function of VGAM2075 is therefore inhibition of

KIAA0712 (Accession NM_014715). Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0712. KIAA1301 (Accession XM_038999) is another VGAM2075 host target gene. KIAA1301 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1301 BINDING SITE, designated SEQ ID:32978, to the nucleotide sequence of VGAM2075 RNA, herein designated VGAM RNA, also designated SEQ ID:4786.

[72487] Another function of VGAM2075 is therefore inhibition of KIAA1301 (Accession XM_038999). Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1301. Seizure Related 6 Homolog (mouse) (SEZ6, Accession XM_058869) is another VGAM2075 host target gene. SEZ6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEZ6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of SEZ6 BINDING SITE, designated SEQ ID:36774, to the nucleotide sequence of VGAM2075 RNA, herein designated VGAM RNA, also designated SEQ ID:4786.

[72488] Another function of VGAM2075 is therefore inhibition of Seizure Related 6 Homolog (mouse) (SEZ6, Accession XM_058869). Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEZ6. VMP1 (Accession NM_030938) is another VGAM2075 host target gene. VMP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VMP1 BINDING SITE, designated SEQ ID:25204, to the nucleotide sequence of VGAM2075 RNA, herein designated VGAM RNA, also designated SEQ ID:4786.

[72489] Another function of VGAM2075 is therefore inhibition of VMP1 (Accession NM_030938). Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VMP1. LOC115110 (Accession XM_049825) is another

VGAM2075 host target gene. LOC115110 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115110 BINDING SITE, designated SEQ ID:35503, to the nucleotide sequence of VGAM2075 RNA, herein designated VGAM RNA, also designated SEQ ID:4786.

[72490] Another function of VGAM2075 is therefore inhibition of LOC115110 (Accession XM_049825). Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115110. LOC132235 (Accession XM_072302) is another VGAM2075 host target gene. LOC132235 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC132235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132235 BINDING SITE, designated SEQ ID:37483, to the nucleotide sequence of VGAM2075 RNA, herein designated VGAM RNA, also designated SEQ ID:4786.

[72491] Another function of VGAM2075 is therefore inhibition of LOC132235 (Accession XM_072302). Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132235. LOC142941 (Accession XM_096363) is another VGAM2075 host target gene. LOC142941 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC142941, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142941 BINDING SITE, designated SEQ ID:40322, to the nucleotide sequence of VGAM2075 RNA, herein designated VGAM RNA, also designated SEQ ID:4786.

[72492] Another function of VGAM2075 is therefore inhibition of LOC142941 (Accession XM_096363). Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142941. LOC158549 (Accession XM_098963) is another VGAM2075 host target gene. LOC158549 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158549, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158549 BINDING SITE, designated SEQ ID:42007, to the nucleotide sequence of VGAM2075 RNA, herein designated VGAM RNA, also designated SEQ ID:4786.

[72493] Another function of VGAM2075 is therefore inhibition of LOC158549 (Accession XM_098963). Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158549. LOC221882 (Accession XM_166507) is another VGAM2075 host target gene. LOC221882 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221882, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221882 BINDING SITE, designated SEQ ID:44434, to the nucleotide sequence of VGAM2075 RNA, herein designated VGAM RNA, also designated SEQ ID:4786.

[72494] Another function of VGAM2075 is therefore inhibition of LOC221882 (Accession XM_166507). Accordingly, utilities of VGAM2075 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221882. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2076 (VGAM2076) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72495] VGAM2076 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2076 was detected is described hereinabove with reference to Figs. 1-8.

[72496] VGAM2076 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM2076 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72497] VGAM2076 gene encodes a VGAM2076 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2076 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2076 precursor RNA is designated SEQ ID:2062, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2062 is located at position 175023 relative to the genome of Variola Virus.

[72498] VGAM2076 precursor RNA folds onto itself, forming VGAM2076 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72499] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2076 folded precursor RNA into VGAM2076 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2076 RNA is designated SEQ ID:4787, and is provided hereinbelow with reference to the sequence listing part.

[72500] VGAM2076 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2076 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2076 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72501] VGAM2076 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2076 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2076 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2076 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2076 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72502] The complementary binding of VGAM2076 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2076 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2076 host target RNA into VGAM2076 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72503] It is appreciated that VGAM2076 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2076 host target genes. The mRNA of each one of this plurality of VGAM2076 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2076 RNA, herein designated VGAM RNA, and which when bound by VGAM2076 RNA causes

inhibition of translation of respective one or more VGAM2076 host target proteins.

[72504] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2076 gene, herein designated VGAM GENE, on one or more VGAM2076 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72505] It is yet further appreciated that a function of VGAM2076 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2076 include diagnosis, prevention and

treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM2076 correlate with, and may be deduced from, the identity of the host target genes which VGAM2076 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72506] Nucleotide sequences of the VGAM2076 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2076 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2076 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2076 are further described hereinbelow with reference to Table 1.

[72507] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2076 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2076 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72508] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2076 gene, herein designated VGAM is inhibition of expression of VGAM2076 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2076 correlate with, and may be deduced from, the identity of the target genes which VGAM2076 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72509] DKFZP434F2021 (Accession XM_039951) is a VGAM2076 host target gene. DKFZP434F2021 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434F2021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434F2021 BINDING SITE, designated SEQ ID:33235, to the nucleotide sequence of VGAM2076 RNA, herein designated VGAM RNA, also designated SEQ ID:4787.

[72510] A function of VGAM2076 is therefore inhibition of DKFZP434F2021 (Accession XM_039951). Accordingly, utilities of VGAM2076 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434F2021. PRO2435 (Accession NM_018527) is another VGAM2076 host target gene. PRO2435 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO2435, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2435 BINDING SITE, designated SEQ ID:20601, to the nucleotide sequence of VGAM2076 RNA, herein designated VGAM RNA, also designated SEQ ID:4787.

[72511] Another function of VGAM2076 is therefore inhibition of PRO2435 (Accession NM_018527). Accordingly, utilities of VGAM2076 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2435. LOC220980 (Accession XM_167629) is another VGAM2076 host target gene. LOC220980 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220980, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220980 BINDING SITE, designated SEQ ID:44740, to the nucleotide sequence of VGAM2076 RNA, herein designated VGAM RNA, also designated SEQ ID:4787.

[72512] Another function of VGAM2076 is therefore inhibition of LOC220980 (Accession XM_167629). Accordingly, utilities of VGAM2076 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC220980. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2077 (VGAM2077) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72513] VGAM2077 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2077 was detected is described hereinabove with reference to Figs. 1-8.

[72514] VGAM2077 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM2077 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72515] VGAM2077 gene encodes a VGAM2077 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2077 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2077 precursor RNA is desig-

nated SEQ ID:2063, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2063 is located at position 178760 relative to the genome of Variola Virus.

[72516] VGAM2077 precursor RNA folds onto itself, forming VGAM2077 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72517] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2077 folded precursor RNA into VGAM2077 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2077 RNA is designated SEQ ID:4788, and is provided hereinbelow with reference to the sequence

listing part.

[72518] VGAM2077 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2077 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2077 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72519] VGAM2077 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2077 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2077 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2077 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2077 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72520] The complementary binding of VGAM2077 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2077 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2077 host target RNA into VGAM2077 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72521] It is appreciated that VGAM2077 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2077 host target genes. The mRNA of each one of this plurality of VGAM2077 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2077 RNA, herein designated VGAM

RNA, and which when bound by VGAM2077 RNA causes inhibition of translation of respective one or more VGAM2077 host target proteins.

[72522] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2077 gene, herein designated VGAM GENE, on one or more VGAM2077 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72523] It is yet further appreciated that a function of VGAM2077 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2077 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM2077 correlate with, and may be deduced from, the identity of the host target genes which VGAM2077 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72524] Nucleotide sequences of the VGAM2077 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2077 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2077 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2077 are further described hereinbelow with reference to Table 1.

[72525] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2077 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2077 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72526] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2077 gene, herein designated VGAM is

inhibition of expression of VGAM2077 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2077 correlate with, and may be deduced from, the identity of the target genes which VGAM2077 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72527] KIAA1582 (Accession XM_037262) is a VGAM2077 host target gene. KIAA1582 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1582, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1582 BINDING SITE, designated SEQ ID:32583, to the nucleotide sequence of VGAM2077 RNA, herein designated VGAM RNA, also designated SEQ ID:4788.

[72528] A function of VGAM2077 is therefore inhibition of KIAA1582 (Accession XM_037262). Accordingly, utilities of VGAM2077 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1582. LOC148709 (Accession XM_086281) is another VGAM2077 host target gene. LOC148709 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by LOC148709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148709 BINDING SITE, designated SEQ ID:38584, to the nucleotide sequence of VGAM2077 RNA, herein designated VGAM RNA, also designated SEQ ID:4788.

[72529] Another function of VGAM2077 is therefore inhibition of LOC148709 (Accession XM_086281). Accordingly, utilities of VGAM2077 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148709. LOC57795 (Accession XM_045110) is another VGAM2077 host target gene. LOC57795 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC57795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57795 BINDING SITE, designated SEQ ID:34359, to the nucleotide sequence of VGAM2077 RNA, herein designated VGAM RNA, also designated SEQ ID:4788.

[72530] Another function of VGAM2077 is therefore inhibition of LOC57795 (Accession XM_045110). Accordingly, utilities

of VGAM2077 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57795. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2078 (VGAM2078) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72531] VGAM2078 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2078 was detected is described hereinabove with reference to Figs. 1-8.

[72532] VGAM2078 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM2078 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72533] VGAM2078 gene encodes a VGAM2078 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2078 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2078 precursor RNA is designated SEQ ID:2064, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2064 is located at position 168720 relative to the genome of Variola Virus.

[72534] VGAM2078 precursor RNA folds onto itself, forming VGAM2078 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72535] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2078 folded precursor RNA into VGAM2078 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM2078 RNA is designated SEQ ID:4789, and

is provided hereinbelow with reference to the sequence listing part.

[72536] VGAM2078 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2078 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2078 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72537] VGAM2078 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2078 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2078 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2078 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2078 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72538] The complementary binding of VGAM2078 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2078 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2078 host target RNA into VGAM2078 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72539] It is appreciated that VGAM2078 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2078 host target genes. The mRNA of each one of this plurality of VGAM2078 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2078 RNA, herein designated VGAM RNA, and which when bound by VGAM2078 RNA causes inhibition of translation of respective one or more VGAM2078 host target proteins.

[72540] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2078 gene, herein designated VGAM GENE, on one or more VGAM2078 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72541] It is yet further appreciated that a function of VGAM2078 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2078 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM2078 correlate with, and may be deduced from, the identity of the host target genes which VGAM2078 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72542] Nucleotide sequences of the VGAM2078 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2078 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2078 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2078 are further described hereinbelow with reference to Table 1.

[72543] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2078 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2078 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72544] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2078 gene, herein designated VGAM is inhibition of expression of VGAM2078 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2078 correlate with, and may be deduced from, the identity of the target genes which VGAM2078 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72545] Capping Protein (actin filament) Muscle Z-line, Alpha 1 (CAPZA1, Accession XM_052116) is a VGAM2078 host target gene. CAPZA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CAPZA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPZA1 BINDING SITE, designated SEQ ID:35947, to the nucleotide sequence of VGAM2078 RNA, herein designated VGAM RNA, also designated SEQ ID:4789.

[72546] A function of VGAM2078 is therefore inhibition of Capping Protein (actin filament) Muscle Z-line, Alpha 1 (CAPZA1, Accession XM_052116), a gene which is alpha 1 subunit of actin filament capping protein; binds actin, has roles in cell motility and actin assembly. Accordingly, util-

ities of VGAM2078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPZA1. The function of CAPZA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM547.DKFZP586M1120 (Accession NM_031294) is another VGAM2078 host target gene. DKFZP586M1120 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP586M1120, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586M1120 BINDING SITE, designated SEQ ID:25325, to the nucleotide sequence of VGAM2078 RNA, herein designated VGAM RNA, also designated SEQ ID:4789.

[72547] Another function of VGAM2078 is therefore inhibition of DKFZP586M1120 (Accession NM_031294). Accordingly, utilities of VGAM2078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586M1120. KIAA0555 (Accession XM_011347) is another VGAM2078 host target gene. KIAA0555 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by KIAA0555, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0555 BINDING SITE, designated SEQ ID:30188, to the nucleotide sequence of VGAM2078 RNA, herein designated VGAM RNA, also designated SEQ ID:4789.

[72548] Another function of VGAM2078 is therefore inhibition of KIAA0555 (Accession XM_011347). Accordingly, utilities of VGAM2078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0555. Pellino Homolog 1 (Drosophila) (PELI1, Accession NM_020651) is another VGAM2078 host target gene. PELI1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PELI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PELI1 BINDING SITE, designated SEQ ID:21819, to the nucleotide sequence of VGAM2078 RNA, herein designated VGAM RNA, also designated SEQ ID:4789.

[72549] Another function of VGAM2078 is therefore inhibition of Pellino Homolog 1 (Drosophila) (PELI1, Accession

NM_020651). Accordingly, utilities of VGAM2078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PELI1. Ras and Rab Interactor 3 (RIN3, Accession NM_024832) is another VGAM2078 host target gene. RIN3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RIN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RIN3 BINDING SITE, designated SEQ ID:24234, to the nucleotide sequence of VGAM2078 RNA, herein designated VGAM RNA, also designated SEQ ID:4789.

[72550] Another function of VGAM2078 is therefore inhibition of Ras and Rab Interactor 3 (RIN3, Accession NM_024832). Accordingly, utilities of VGAM2078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RIN3. LOC133686 (Accession XM_059667) is another VGAM2078 host target gene. LOC133686 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC133686, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133686 BINDING SITE, designated SEQ ID:37055, to the nucleotide sequence of VGAM2078 RNA, herein designated VGAM RNA, also designated SEQ ID:4789.

[72551] Another function of VGAM2078 is therefore inhibition of LOC133686 (Accession XM_059667). Accordingly, utilities of VGAM2078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133686. LOC153205 (Accession XM_098322) is another VGAM2078 host target gene. LOC153205 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153205 BINDING SITE, designated SEQ ID:41582, to the nucleotide sequence of VGAM2078 RNA, herein designated VGAM RNA, also designated SEQ ID:4789.

[72552] Another function of VGAM2078 is therefore inhibition of LOC153205 (Accession XM_098322). Accordingly, utilities of VGAM2078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC153205. LOC221810 (Accession XM_168222) is another VGAM2078 host target gene. LOC221810 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221810, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221810 BINDING SITE, designated SEQ ID:45084, to the nucleotide sequence of VGAM2078 RNA, herein designated VGAM RNA, also designated SEQ ID:4789.

[72553] Another function of VGAM2078 is therefore inhibition of LOC221810 (Accession XM_168222). Accordingly, utilities of VGAM2078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221810. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2079 (VGAM2079) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72554] VGAM2079 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2079 was detected is described hereinabove with reference to Figs. 1-8.

[72555] VGAM2079 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM2079 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72556] VGAM2079 gene encodes a VGAM2079 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2079 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2079 precursor RNA is designated SEQ ID:2065, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2065 is located at position 171525 relative to the genome of Variola Virus.

[72557] VGAM2079 precursor RNA folds onto itself, forming VGAM2079 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72558] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2079 folded precursor RNA into VGAM2079 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2079 RNA is designated SEQ ID:4790, and is provided hereinbelow with reference to the sequence listing part.

[72559] VGAM2079 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2079 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2079 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72560] VGAM2079 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2079 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2079 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2079 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2079 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72561] The complementary binding of VGAM2079 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2079 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2079 host target RNA into VGAM2079 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72562] It is appreciated that VGAM2079 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2079 host target genes. The mRNA of each one of this plurality of VGAM2079 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2079 RNA, herein designated VGAM RNA, and which when bound by VGAM2079 RNA causes inhibition of translation of respective one or more VGAM2079 host target proteins.

[72563] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2079 gene, herein designated VGAM GENE, on one or more VGAM2079 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72564] It is yet further appreciated that a function of VGAM2079 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2079 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM2079 correlate with, and may be deduced from, the identity of the host target genes which VGAM2079 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72565] Nucleotide sequences of the VGAM2079 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2079 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2079 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2079 are further described hereinbelow with reference to Table 1.

[72566] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2079 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2079 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72567] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2079 gene, herein designated VGAM is inhibition of expression of VGAM2079 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2079 correlate with, and may be deduced from, the identity of the target genes which VGAM2079 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72568] DXF68S1E (Accession XM_010289) is a VGAM2079 host target gene. DXF68S1E BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DXF68S1E, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DXF68S1E BINDING SITE, designated SEQ ID:30151, to the nucleotide sequence of VGAM2079 RNA, herein designated VGAM RNA, also designated SEQ ID:4790.

[72569] A function of VGAM2079 is therefore inhibition of DXF68S1E (Accession XM_010289). Accordingly, utilities of VGAM2079 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DXF68S1E. Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM_002655) is another VGAM2079 host target gene. PLAG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAG1 BINDING SITE, designated SEQ ID:8517, to the nucleotide sequence of VGAM2079 RNA, herein designated VGAM RNA, also designated SEQ ID:4790.

[72570] Another function of VGAM2079 is therefore inhibition of Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM_002655), a gene which contains a zinc finger domain.

Accordingly, utilities of VGAM2079 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAG1. The function of PLAG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM29.ELL2 (Accession NM_012081) is another VGAM2079 host target gene. ELL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ELL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELL2 BINDING SITE, designated SEQ ID:14366, to the nucleotide sequence of VGAM2079 RNA, herein designated VGAM RNA, also designated SEQ ID:4790.

[72571] Another function of VGAM2079 is therefore inhibition of ELL2 (Accession NM_012081). Accordingly, utilities of VGAM2079 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELL2. KIAA0090 (Accession XM_114045) is another VGAM2079 host target gene. KIAA0090 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0090, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0090 BINDING SITE, designated SEQ ID:42652, to the nucleotide sequence of VGAM2079 RNA, herein designated VGAM RNA, also designated SEQ ID:4790.

[72572] Another function of VGAM2079 is therefore inhibition of KIAA0090 (Accession XM_114045). Accordingly, utilities of VGAM2079 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0090. KIAA1622 (Accession NM_058237) is another VGAM2079 host target gene. KIAA1622 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1622 BINDING SITE, designated SEQ ID:27764, to the nucleotide sequence of VGAM2079 RNA, herein designated VGAM RNA, also designated SEQ ID:4790.

[72573] Another function of VGAM2079 is therefore inhibition of KIAA1622 (Accession NM_058237). Accordingly, utilities of VGAM2079 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1622. RAS-like, Estrogen-regulated, Growth-inhibitor (RERG, Accession NM_032918) is another VGAM2079 host target gene. RERG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RERG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RERG BINDING SITE, designated SEQ ID:26738, to the nucleotide sequence of VGAM2079 RNA, herein designated VGAM RNA, also designated SEQ ID:4790.

[72574] Another function of VGAM2079 is therefore inhibition of RAS-like, Estrogen-regulated, Growth-inhibitor (RERG, Accession NM_032918). Accordingly, utilities of VGAM2079 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RERG. LOC221288 (Accession XM_168058) is another VGAM2079 host target gene. LOC221288 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC221288 BINDING SITE, designated SEQ ID:44970, to the nucleotide sequence of VGAM2079 RNA, herein designated VGAM RNA, also designated SEQ ID:4790.

[72575] Another function of VGAM2079 is therefore inhibition of LOC221288 (Accession XM_168058). Accordingly, utilities of VGAM2079 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221288. LOC90488 (Accession XM_032129) is another VGAM2079 host target gene. LOC90488 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90488 BINDING SITE, designated SEQ ID:31557, to the nucleotide sequence of VGAM2079 RNA, herein designated VGAM RNA, also designated SEQ ID:4790.

[72576] Another function of VGAM2079 is therefore inhibition of LOC90488 (Accession XM_032129). Accordingly, utilities of VGAM2079 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90488. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2080 (VGAM2080) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72577] VGAM2080 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2080 was detected is described hereinabove with reference to Figs. 1-8.

[72578] VGAM2080 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM2080 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72579] VGAM2080 gene encodes a VGAM2080 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2080 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2080 precursor RNA is designated SEQ ID:2066, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2066 is located at position 176691 relative to the genome of Variola Virus.

[72580] VGAM2080 precursor RNA folds onto itself, forming VGAM2080 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72581] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2080 folded precursor RNA into VGAM2080 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM2080 RNA is designated SEQ ID:4791, and is provided hereinbelow with reference to the sequence listing part.

[72582] VGAM2080 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2080 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2080 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72583] VGAM2080 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2080 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2080 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2080 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2080 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72584] The complementary binding of VGAM2080 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2080 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2080 host target RNA into VGAM2080 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72585] It is appreciated that VGAM2080 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2080 host target genes. The mRNA of each one of this plurality of VGAM2080 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2080 RNA, herein designated VGAM RNA, and which when bound by VGAM2080 RNA causes inhibition of translation of respective one or more

VGAM2080 host target proteins.

[72586] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2080 gene, herein designated VGAM GENE, on one or more VGAM2080 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72587] It is yet further appreciated that a function of VGAM2080 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2080 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific func-

tions, and accordingly utilities, of VGAM2080 correlate with, and may be deduced from, the identity of the host target genes which VGAM2080 binds and inhibits, and the function of these host target genes, as elaborated herein-below.

[72588] Nucleotide sequences of the VGAM2080 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2080 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2080 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2080 are further described hereinbelow with reference to Table 1.

[72589] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2080 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2080 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72590] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2080 gene, herein designated VGAM is inhibition of expression of VGAM2080 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2080 correlate with, and may be deduced from, the identity of the target genes which VGAM2080 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72591] Chemokine (C-X3-C motif) Receptor 1 (CX3CR1, Accession XM_047502) is a VGAM2080 host target gene. CX3CR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CX3CR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CX3CR1 BINDING SITE, designated SEQ ID:34983, to the nucleotide sequence of VGAM2080 RNA, herein designated VGAM RNA, also designated SEQ ID:4791.

[72592] A function of VGAM2080 is therefore inhibition of Chemokine (C-X3-C motif) Receptor 1 (CX3CR1, Accession XM_047502), a gene which mediates both the adhesive and migratory functions of fractalkine. Accordingly, utilities of VGAM2080 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CX3CR1. The function of CX3CR1 and its association with various diseases and clinical conditions, has been es-

tablished by previous studies, as described hereinabove with reference to VGAM25.KIAA0720 (Accession XM_030970) is another VGAM2080 host target gene. KIAA0720 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0720, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0720 BINDING SITE, designated SEQ ID:31231, to the nucleotide sequence of VGAM2080 RNA, herein designated VGAM RNA, also designated SEQ ID:4791.

[72593] Another function of VGAM2080 is therefore inhibition of KIAA0720 (Accession XM_030970). Accordingly, utilities of VGAM2080 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0720. KIAA1102 (Accession XM_044461) is another VGAM2080 host target gene. KIAA1102 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1102, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1102 BINDING SITE, designated SEQ ID:34213, to the nucleotide sequence of VGAM2080 RNA, herein designated VGAM RNA, also designated SEQ ID:4791.

[72594] Another function of VGAM2080 is therefore inhibition of KIAA1102 (Accession XM_044461). Accordingly, utilities of VGAM2080 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1102. KIAA1257 (Accession XM_031577) is another VGAM2080 host target gene. KIAA1257 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1257, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1257 BINDING SITE, designated SEQ ID:31430, to the nucleotide sequence of VGAM2080 RNA, herein designated VGAM RNA, also designated SEQ ID:4791.

[72595] Another function of VGAM2080 is therefore inhibition of KIAA1257 (Accession XM_031577). Accordingly, utilities of VGAM2080 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1257. PFTAIRE Protein Kinase 1 (PFTK1, Accession NM_012395) is another VGAM2080 host target gene.

PFTK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PFTK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PFTK1 BINDING SITE, designated SEQ ID:14751, to the nucleotide sequence of VGAM2080 RNA, herein designated VGAM RNA, also designated SEQ ID:4791.

[72596] Another function of VGAM2080 is therefore inhibition of PFTAIRE Protein Kinase 1 (PFTK1, Accession NM_012395). Accordingly, utilities of VGAM2080 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFTK1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2081 (VGAM2081) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72597] VGAM2081 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2081 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[72598] VGAM2081 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM2081 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72599] VGAM2081 gene encodes a VGAM2081 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2081 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2081 precursor RNA is designated SEQ ID:2067, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2067 is located at position 180298 relative to the genome of Variola Virus.

[72600] VGAM2081 precursor RNA folds onto itself, forming VGAM2081 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72601] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2081 folded precursor RNA into VGAM2081 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2081 RNA is designated SEQ ID:4792, and is provided hereinbelow with reference to the sequence listing part.

[72602] VGAM2081 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2081 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2081 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72603] VGAM2081 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2081 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2081 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2081 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2081 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72604] The complementary binding of VGAM2081 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2081 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2081 host target RNA into VGAM2081 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72605] It is appreciated that VGAM2081 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2081 host target genes. The mRNA of each one of this plurality of VGAM2081 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2081 RNA, herein designated VGAM RNA, and which when bound by VGAM2081 RNA causes inhibition of translation of respective one or more VGAM2081 host target proteins.

[72606] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2081 gene, herein designated VGAM GENE, on one or more VGAM2081 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72607] It is yet further appreciated that a function of VGAM2081 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2081 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM2081 correlate with, and may be deduced from, the identity of the host target genes which VGAM2081 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72608] Nucleotide sequences of the VGAM2081 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2081 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2081 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2081 are further described hereinbelow with reference to Table 1.

[72609] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2081 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2081 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72610] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2081 gene, herein designated VGAM is inhibition of expression of VGAM2081 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2081 correlate with, and may be deduced from, the identity of the target genes which VGAM2081 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72611] Ceroid-lipofuscinosis, Neuronal 5 (CLN5, Accession NM_006493) is a VGAM2081 host target gene. CLN5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CLN5, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLN5 BINDING SITE, designated SEQ ID:13226, to the nucleotide sequence of VGAM2081 RNA, herein designated VGAM RNA, also designated SEQ ID:4792.

[72612] A function of VGAM2081 is therefore inhibition of Ceroid-lipofuscinosis, Neuronal 5 (CLN5, Accession NM_006493). Accordingly, utilities of VGAM2081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLN5. ADP-ribosylation Factor GTPase Activating Protein 3 (ARFGAP3, Accession NM_014570) is another VGAM2081 host target gene. ARFGAP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARFGAP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARFGAP3 BINDING SITE, designated SEQ ID:15925, to the nucleotide sequence of VGAM2081 RNA, herein designated VGAM RNA, also designated SEQ ID:4792.

[72613] Another function of VGAM2081 is therefore inhibition of ADP-ribosylation Factor GTPase Activating Protein 3

(ARFGAP3, Accession NM_014570). Accordingly, utilities of VGAM2081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARFGAP3. FLJ30532 (Accession NM_144724) is another VGAM2081 host target gene. FLJ30532 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ30532, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30532 BINDING SITE, designated SEQ ID:29546, to the nucleotide sequence of VGAM2081 RNA, herein designated VGAM RNA, also designated SEQ ID:4792.

[72614] Another function of VGAM2081 is therefore inhibition of FLJ30532 (Accession NM_144724). Accordingly, utilities of VGAM2081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30532. KIAA0319 (Accession NM_014809) is another VGAM2081 host target gene. KIAA0319 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0319 BINDING SITE, designated SEQ ID:16764, to the nucleotide sequence of VGAM2081 RNA, herein designated VGAM RNA, also designated SEQ ID:4792.

[72615] Another function of VGAM2081 is therefore inhibition of KIAA0319 (Accession NM_014809). Accordingly, utilities of VGAM2081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0319. KIAA0416 (Accession NM_015564) is another VGAM2081 host target gene. KIAA0416 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0416 BINDING SITE, designated SEQ ID:17834, to the nucleotide sequence of VGAM2081 RNA, herein designated VGAM RNA, also designated SEQ ID:4792.

[72616] Another function of VGAM2081 is therefore inhibition of KIAA0416 (Accession NM_015564). Accordingly, utilities of VGAM2081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0416. KIAA0555 (Accession XM_011347) is another

VGAM2081 host target gene. KIAA0555 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0555, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0555 BINDING SITE, designated SEQ ID:30186, to the nucleotide sequence of VGAM2081 RNA, herein designated VGAM RNA, also designated SEQ ID:4792.

[72617] Another function of VGAM2081 is therefore inhibition of KIAA0555 (Accession XM_011347). Accordingly, utilities of VGAM2081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0555. MGC30052 (Accession NM_144721) is another VGAM2081 host target gene. MGC30052 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC30052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC30052 BINDING SITE, designated SEQ ID:29542, to the nucleotide sequence of VGAM2081 RNA, herein designated VGAM RNA, also designated SEQ ID:4792.

[72618] Another function of VGAM2081 is therefore inhibition of MGC30052 (Accession NM_144721). Accordingly, utilities of VGAM2081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC30052. MGC5139 (Accession XM_058587) is another VGAM2081 host target gene. MGC5139 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC5139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5139 BINDING SITE, designated SEQ ID:36677, to the nucleotide sequence of VGAM2081 RNA, herein designated VGAM RNA, also designated SEQ ID:4792.

[72619] Another function of VGAM2081 is therefore inhibition of MGC5139 (Accession XM_058587). Accordingly, utilities of VGAM2081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5139. NSG-X (Accession NM_014411) is another VGAM2081 host target gene. NSG-X BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NSG-X, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NSG-X BINDING SITE, designated SEQ ID:15754, to the nucleotide sequence of VGAM2081 RNA, herein designated VGAM RNA, also designated SEQ ID:4792.

[72620] Another function of VGAM2081 is therefore inhibition of NSG-X (Accession NM_014411). Accordingly, utilities of VGAM2081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NSG-X. Solute Carrier Family 12, (potassium-chloride transporter) Member 5 (SLC12A5, Accession NM_020708) is another VGAM2081 host target gene. SLC12A5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC12A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC12A5 BINDING SITE, designated SEQ ID:21856, to the nucleotide sequence of VGAM2081 RNA, herein designated VGAM RNA, also designated SEQ ID:4792.

[72621] Another function of VGAM2081 is therefore inhibition of Solute Carrier Family 12, (potassium-chloride transporter) Member 5 (SLC12A5, Accession NM_020708). Accordingly,

utilities of VGAM2081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC12A5. TRIP-Br2 (Accession NM_014755) is another VGAM2081 host target gene. TRIP-Br2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIP-Br2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIP-Br2 BINDING SITE, designated SEQ ID:16489, to the nucleotide sequence of VGAM2081 RNA, herein designated VGAM RNA, also designated SEQ ID:4792.

[72622] Another function of VGAM2081 is therefore inhibition of TRIP-Br2 (Accession NM_014755). Accordingly, utilities of VGAM2081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP-Br2. LOC128954 (Accession XM_066252) is another VGAM2081 host target gene. LOC128954 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC128954, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC128954 BINDING SITE, designated SEQ ID:37320, to the nucleotide sequence of VGAM2081 RNA, herein designated VGAM RNA, also designated SEQ ID:4792.

[72623] Another function of VGAM2081 is therefore inhibition of LOC128954 (Accession XM_066252). Accordingly, utilities of VGAM2081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128954. LOC91948 (Accession XM_041723) is another VGAM2081 host target gene. LOC91948 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91948, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91948 BINDING SITE, designated SEQ ID:33574, to the nucleotide sequence of VGAM2081 RNA, herein designated VGAM RNA, also designated SEQ ID:4792.

[72624] Another function of VGAM2081 is therefore inhibition of LOC91948 (Accession XM_041723). Accordingly, utilities of VGAM2081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91948. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2082 (VGAM2082) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72625] VGAM2082 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2082 was detected is described hereinabove with reference to Figs. 1-8.

[72626] VGAM2082 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM2082 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72627] VGAM2082 gene encodes a VGAM2082 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2082 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2082 precursor RNA is designated SEQ ID:2068, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2068 is located at position 174739 relative to the

genome of Variola Virus.

[72628] VGAM2082 precursor RNA folds onto itself, forming VGAM2082 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72629] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2082 folded precursor RNA into VGAM2082 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2082 RNA is designated SEQ ID:4793, and is provided hereinbelow with reference to the sequence listing part.

[72630] VGAM2082 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2082 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2082 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72631] VGAM2082 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2082 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2082 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2082 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2082 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72632] The complementary binding of VGAM2082 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2082 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2082 host target RNA into VGAM2082 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72633] It is appreciated that VGAM2082 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2082 host target genes. The mRNA of each one of this plurality of VGAM2082 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2082 RNA, herein designated VGAM RNA, and which when bound by VGAM2082 RNA causes inhibition of translation of respective one or more VGAM2082 host target proteins.

[72634] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2082 gene, herein designated VGAM GENE, on one or more VGAM2082 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72635] It is yet further appreciated that a function of VGAM2082 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2082 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM2082 correlate

with, and may be deduced from, the identity of the host target genes which VGAM2082 binds and inhibits, and the function of these host target genes, as elaborated herein-below.

[72636] Nucleotide sequences of the VGAM2082 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2082 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2082 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2082 are further described hereinbelow with reference to Table 1.

[72637] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2082 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2082 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72638] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2082 gene, herein designated VGAM is inhibition of expression of VGAM2082 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2082 correlate with, and may be deduced

from, the identity of the target genes which VGAM2082 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72639] Capping Protein (actin filament) Muscle Z-line, Alpha 1 (CAPZA1, Accession XM_052116) is a VGAM2082 host target gene. CAPZA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CAPZA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPZA1 BINDING SITE, designated SEQ ID:35952, to the nucleotide sequence of VGAM2082 RNA, herein designated VGAM RNA, also designated SEQ ID:4793.

[72640] A function of VGAM2082 is therefore inhibition of Capping Protein (actin filament) Muscle Z-line, Alpha 1 (CAPZA1, Accession XM_052116), a gene which is alpha 1 subunit of actin filament capping protein; binds actin, has roles in cell motility and actin assembly. Accordingly, utilities of VGAM2082 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPZA1. The function of CAPZA1 and its association with various diseases and clinical conditions, has been es-

tablished by previous studies, as described hereinabove with reference to VGAM547.Frizzled Homolog 4 (Drosophila) (FZD4, Accession NM_012193) is another VGAM2082 host target gene. FZD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FZD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD4 BINDING SITE, designated SEQ ID:14485, to the nucleotide sequence of VGAM2082 RNA, herein designated VGAM RNA, also designated SEQ ID:4793.

[72641] Another function of VGAM2082 is therefore inhibition of Frizzled Homolog 4 (Drosophila) (FZD4, Accession NM_012193), a gene which may function in cell polarity, cell fate specification and cancer; similar to frizzled receptor family, has seven transmembrane domains. Accordingly, utilities of VGAM2082 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FZD4. The function of FZD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM309.Solute Carrier Family

17 (sodium phosphate), Member 4 (SLC17A4, Accession NM_005495) is another VGAM2082 host target gene. SLC17A4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC17A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC17A4 BINDING SITE, designated SEQ ID:11997, to the nucleotide sequence of VGAM2082 RNA, herein designated VGAM RNA, also designated SEQ ID:4793.

[72642] Another function of VGAM2082 is therefore inhibition of Solute Carrier Family 17 (sodium phosphate), Member 4 (SLC17A4, Accession NM_005495). Accordingly, utilities of VGAM2082 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC17A4. C6orf5 (Accession NM_015524) is another VGAM2082 host target gene. C6orf5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C6orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf5 BIND-

ING SITE, designated SEQ ID:17781, to the nucleotide sequence of VGAM2082 RNA, herein designated VGAM RNA, also designated SEQ ID:4793.

[72643] Another function of VGAM2082 is therefore inhibition of C6orf5 (Accession NM_015524). Accordingly, utilities of VGAM2082 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf5. DKFZp434G179 (Accession XM_087065) is another VGAM2082 host target gene. DKFZp434G179 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434G179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434G179 BINDING SITE, designated SEQ ID:39041, to the nucleotide sequence of VGAM2082 RNA, herein designated VGAM RNA, also designated SEQ ID:4793.

[72644] Another function of VGAM2082 is therefore inhibition of DKFZp434G179 (Accession XM_087065). Accordingly, utilities of VGAM2082 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434G179. FLJ20712 (Accession NM_017937) is

another VGAM2082 host target gene. FLJ20712 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20712, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20712 BINDING SITE, designated SEQ ID:19629, to the nucleotide sequence of VGAM2082 RNA, herein designated VGAM RNA, also designated SEQ ID:4793.

[72645] Another function of VGAM2082 is therefore inhibition of FLJ20712 (Accession NM_017937). Accordingly, utilities of VGAM2082 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20712. KIAA1301 (Accession XM_038999) is another VGAM2082 host target gene. KIAA1301 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1301 BINDING SITE, designated SEQ ID:32977, to the nucleotide sequence of VGAM2082 RNA, herein designated VGAM RNA, also designated SEQ ID:4793.

[72646] Another function of VGAM2082 is therefore inhibition of KIAA1301 (Accession XM_038999). Accordingly, utilities of VGAM2082 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1301. Retinoic Acid Induced 17 (RAI17, Accession XM_166091) is another VGAM2082 host target gene. RAI17 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAI17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI17 BINDING SITE, designated SEQ ID:43857, to the nucleotide sequence of VGAM2082 RNA, herein designated VGAM RNA, also designated SEQ ID:4793.

[72647] Another function of VGAM2082 is therefore inhibition of Retinoic Acid Induced 17 (RAI17, Accession XM_166091). Accordingly, utilities of VGAM2082 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI17. LOC150630 (Accession XM_097931) is another VGAM2082 host target gene. LOC150630 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150630, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150630 BINDING SITE, designated SEQ ID:41236, to the nucleotide sequence of VGAM2082 RNA, herein designated VGAM RNA, also designated SEQ ID:4793.

[72648] Another function of VGAM2082 is therefore inhibition of LOC150630 (Accession XM_097931). Accordingly, utilities of VGAM2082 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150630. LOC153259 (Accession XM_098342) is another VGAM2082 host target gene. LOC153259 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153259 BINDING SITE, designated SEQ ID:41601, to the nucleotide sequence of VGAM2082 RNA, herein designated VGAM RNA, also designated SEQ ID:4793.

[72649] Another function of VGAM2082 is therefore inhibition of LOC153259 (Accession XM_098342). Accordingly, utilities of VGAM2082 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC153259. LOC201799 (Accession XM_114380) is another VGAM2082 host target gene. LOC201799 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201799, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201799 BINDING SITE, designated SEQ ID:42911, to the nucleotide sequence of VGAM2082 RNA, herein designated VGAM RNA, also designated SEQ ID:4793.

[72650] Another function of VGAM2082 is therefore inhibition of LOC201799 (Accession XM_114380). Accordingly, utilities of VGAM2082 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201799. LOC219578 (Accession XM_170012) is another VGAM2082 host target gene. LOC219578 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219578, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219578 BINDING SITE, designated SEQ ID:45308, to

the nucleotide sequence of VGAM2082 RNA, herein designated VGAM RNA, also designated SEQ ID:4793.

[72651] Another function of VGAM2082 is therefore inhibition of LOC219578 (Accession XM_170012). Accordingly, utilities of VGAM2082 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219578. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2083 (VGAM2083) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72652] VGAM2083 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2083 was detected is described hereinabove with reference to Figs. 1-8.

[72653] VGAM2083 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM2083 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72654] VGAM2083 gene encodes a VGAM2083 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2083 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2083 precursor RNA is designated SEQ ID:2069, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2069 is located at position 190806 relative to the genome of Camelpox Virus.

[72655] VGAM2083 precursor RNA folds onto itself, forming VGAM2083 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72656] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2083 folded precursor RNA into VGAM2083 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2083 RNA is designated SEQ ID:4794, and is provided hereinbelow with reference to the sequence listing part.

[72657] VGAM2083 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2083 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2083 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72658] VGAM2083 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2083 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2083 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2083 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2083 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72659] The complementary binding of VGAM2083 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2083 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2083 host target RNA into VGAM2083 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72660] It is appreciated that VGAM2083 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2083 host target genes. The mRNA of each one of this plurality of VGAM2083 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2083 RNA, herein designated VGAM RNA, and which when bound by VGAM2083 RNA causes inhibition of translation of respective one or more VGAM2083 host target proteins.

[72661] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2083 gene, herein designated VGAM GENE, on one or more VGAM2083 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72662] It is yet further appreciated that a function of VGAM2083 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2083 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM2083 correlate with, and may be deduced from, the identity of the host target genes which VGAM2083 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72663] Nucleotide sequences of the VGAM2083 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2083 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2083 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2083 are further described hereinbelow with reference to Table 1.

[72664] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2083 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2083 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72665] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2083 gene, herein designated VGAM is inhibition of expression of VGAM2083 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2083 correlate with, and may be deduced from, the identity of the target genes which VGAM2083 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72666] CDK2-associated Protein 1 (CDK2AP1, Accession NM_004642) is a VGAM2083 host target gene. CDK2AP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDK2AP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDK2AP1 BINDING SITE, designated SEQ ID:11017, to the nucleotide sequence of VGAM2083 RNA, herein designated VGAM RNA, also designated SEQ ID:4794.

[72667] A function of VGAM2083 is therefore inhibition of

CDK2-associated Protein 1 (CDK2AP1, Accession NM_004642), a gene which negatively regulates CDK2 activity. Accordingly, utilities of VGAM2083 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK2AP1. The function of CDK2AP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1923.UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 7 (GalNAc-T7) (GALNT7, Accession NM_017423) is another VGAM2083 host target gene. GALNT7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GALNT7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNT7 BINDING SITE, designated SEQ ID:18876, to the nucleotide sequence of VGAM2083 RNA, herein designated VGAM RNA, also designated SEQ ID:4794.

[72668] Another function of VGAM2083 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 7 (GalNAc-T7) (GALNT7,

Accession NM_017423). Accordingly, utilities of VGAM2083 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT7. RAP1 (Accession NM_018975) is another VGAM2083 host target gene. RAP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP1 BINDING SITE, designated SEQ ID:21046, to the nucleotide sequence of VGAM2083 RNA, herein designated VGAM RNA, also designated SEQ ID:4794.

[72669] Another function of VGAM2083 is therefore inhibition of RAP1 (Accession NM_018975), a gene which is an ortholog of the yeast telomeric protein Rap1 and may be a general characteristic of sequence-specific transcriptional factors. Accordingly, utilities of VGAM2083 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP1. The function of RAP1 has been established by previous studies. By performing a yeast 2-hybrid screen on a HeLa cell cDNA library using telomeric repeat-binding factor-2, or TRF2 (TERF2;

602027), as bait, followed by screening a breast cancer cDNA library, Li et al. (2000) isolated a full-length cDNA encoding RAP1, an ortholog of the yeast telomeric protein Rap1. The RAP1 cDNA is identical to the KAIA804 cDNA (GenBank AK000669) reported by the NEDO Japanese sequencing project. The predicted 47-kD RAP1 protein contains 399 amino acids. A motif search revealed that RAP1 has an N-terminal BRCT domain and a central Myb-type helix-turn-helix motif. RAP1 also has an acidic C terminus (amino acids 214 to 382; pI around 3.8) featuring a predicted 33-amino acid coiled-coil region and a bipartite nuclear localization signal. Sequence alignments showed an additional region of sequence similarity in the C termini of yeast and human RAP1 that coincides with the main protein-protein interaction domain of S. cerevisiae Rap1. Thus, human RAP1 has 3 conserved sequence motifs in common with yeast Rap1. Northern blot analysis detected ubiquitous expression of a 2.5-kb RAP1 transcript. The authors found that RAP1 is located at telomeres and affects telomere length. However, while yeast Rap1 binds telomeric DNA directly, human RAP1 is recruited to telomeres by TRF2. Extending the comparison of telomeric proteins to fission yeast, Li et al. (2000) iden-

tified the S. pombe Taz1 protein as a TRF ortholog, indicating that TRFs are conserved at eukaryotic telomeres. The data suggested that ancestral telomeres, like those of vertebrates, contained a TRF-like protein as well as RAP1. The authors proposed that budding yeast preserved Rap1 at telomeres but lost the TRF component, possibly concomitant with a change in the telomeric repeat sequence. Lieb et al. (2001) determined the distribution of RAP1 in vivo on the entire yeast genome, at a resolution of 2 kb. RAP1 is central to the cellular economy during rapid growth, targeting 294 loci, about 5% of yeast genes, and participating in the activation of 37% of all RNA polymerase II (see OMIM Ref. No. 180660) initiation events in exponentially growing cells. Although the DNA sequence recognized by RAP1 is found in both coding and intergenic sequences, the binding of RAP1 to the genome was highly specific to intergenic regions with the potential to act as promoters. Lieb et al. (2001) concluded that this global phenomenon, which may be a general characteristic of sequence-specific transcriptional factors, indicates the existence of a genomewide molecular mechanism for marking promoter regions.

[72670] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[72671] Li, B.; Oestreich, S.; de Lange, T. : Identification of human Rap1: implications for telomere evolution. Cell 101: 471-483, 2000. ; and

[72672] Lieb, J. D.; Liu, X.; Botstein, D.; Brown, P. O. : Promoter-specific binding of Rap1 revealed by genome-wide maps of protein-DNA association. Nature Genet. 28: 327-334, 2001.

[72673] Further studies establishing the function and utilities of RAP1 are found in John Hopkins OMIM database record ID 605061, and in sited publications numbered 6797-6798 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.KIAA1096 (Accession XM_043678) is another VGAM2083 host target gene. KIAA1096 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1096, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1096 BINDING SITE, designated SEQ ID:33998, to the nucleotide sequence of VGAM2083 RNA, herein designated VGAM RNA, also designated SEQ

ID:4794.

[72674] Another function of VGAM2083 is therefore inhibition of KIAA1096 (Accession XM_043678). Accordingly, utilities of VGAM2083 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1096. PRO0097 (Accession NM_014114) is another VGAM2083 host target gene. PRO0097 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0097, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0097 BINDING SITE, designated SEQ ID:15367, to the nucleotide sequence of VGAM2083 RNA, herein designated VGAM RNA, also designated SEQ ID:4794.

[72675] Another function of VGAM2083 is therefore inhibition of PRO0097 (Accession NM_014114). Accordingly, utilities of VGAM2083 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0097. LOC255196 (Accession XM_173157) is another VGAM2083 host target gene. LOC255196 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255196, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255196 BINDING SITE, designated SEQ ID:46416, to the nucleotide sequence of VGAM2083 RNA, herein designated VGAM RNA, also designated SEQ ID:4794.

[72676] Another function of VGAM2083 is therefore inhibition of LOC255196 (Accession XM_173157). Accordingly, utilities of VGAM2083 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255196. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2084 (VGAM2084) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72677] VGAM2084 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2084 was detected is described hereinabove with reference to Figs. 1-8.

[72678] VGAM2084 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus.

VGAM2084 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72679] VGAM2084 gene encodes a VGAM2084 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2084 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2084 precursor RNA is designated SEQ ID:2070, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2070 is located at position 170712 relative to the genome of Variola Virus.

[72680] VGAM2084 precursor RNA folds onto itself, forming VGAM2084 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72681] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2084 folded precursor RNA into VGAM2084 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM2084 RNA is designated SEQ ID:4795, and is provided hereinbelow with reference to the sequence listing part.

[72682] VGAM2084 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2084 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2084 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72683] VGAM2084 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2084 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2084 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2084 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2084 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72684] The complementary binding of VGAM2084 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2084 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2084 host target RNA into VGAM2084 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72685] It is appreciated that VGAM2084 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2084 host target genes. The mRNA of each one of this plurality of VGAM2084 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2084 RNA, herein designated VGAM RNA, and which when bound by VGAM2084 RNA causes inhibition of translation of respective one or more VGAM2084 host target proteins.

[72686] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2084 gene, herein designated VGAM GENE, on one or more VGAM2084 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72687] It is yet further appreciated that a function of VGAM2084 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2084 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM2084 correlate with, and may be deduced from, the identity of the host target genes which VGAM2084 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72688] Nucleotide sequences of the VGAM2084 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2084 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2084 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2084 are further described hereinbelow with reference to Table 1.

[72689] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2084 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2084 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72690] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2084 gene, herein designated VGAM is inhibition of expression of VGAM2084 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2084 correlate with, and may be deduced from, the identity of the target genes which VGAM2084 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72691] Cytochrome P450, Subfamily I (dioxin-inducible), Polypeptide 1 (glaucoma 3, primary infantile) (CYP1B1, Accession NM_000104) is a VGAM2084 host target gene. CYP1B1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CYP1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of CYP1B1 BINDING SITE, designated SEQ ID:5566, to the nucleotide sequence of VGAM2084 RNA, herein designated VGAM RNA, also designated SEQ ID:4795.

[72692] A function of VGAM2084 is therefore inhibition of Cytochrome P450, Subfamily I (dioxin-inducible), Polypeptide 1 (glaucoma 3, primary infantile) (CYP1B1, Accession NM_000104), a gene which participates in the metabolism of a molecule that is a participant in eye development. Accordingly, utilities of VGAM2084 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP1B1. The function of CYP1B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM894.FLJ14803 (Accession NM_032842) is another VGAM2084 host target gene. FLJ14803 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14803, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14803 BINDING SITE, designated SEQ ID:26628, to the nucleotide sequence of VGAM2084

RNA, herein designated VGAM RNA, also designated SEQ ID:4795.

[72693] Another function of VGAM2084 is therefore inhibition of FLJ14803 (Accession NM_032842). Accordingly, utilities of VGAM2084 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14803. Protein Tyrosine Kinase 9 (PTK9, Accession NM_002822) is another VGAM2084 host target gene. PTK9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTK9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTK9 BINDING SITE, designated SEQ ID:8690, to the nucleotide sequence of VGAM2084 RNA, herein designated VGAM RNA, also designated SEQ ID:4795.

[72694] Another function of VGAM2084 is therefore inhibition of Protein Tyrosine Kinase 9 (PTK9, Accession NM_002822). Accordingly, utilities of VGAM2084 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTK9. LOC122773 (Accession XM_058665) is another VGAM2084 host target gene. LOC122773 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by LOC122773, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122773 BINDING SITE, designated SEQ ID:36711, to the nucleotide sequence of VGAM2084 RNA, herein designated VGAM RNA, also designated SEQ ID:4795.

[72695] Another function of VGAM2084 is therefore inhibition of LOC122773 (Accession XM_058665). Accordingly, utilities of VGAM2084 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122773. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2085 (VGAM2085) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72696] VGAM2085 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2085 was detected is described hereinabove with reference to Figs. 1-8.

[72697] VGAM2085 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM2085 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72698] VGAM2085 gene encodes a VGAM2085 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2085 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2085 precursor RNA is designated SEQ ID:2071, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2071 is located at position 96465 relative to the genome of Fowlpox Virus.

[72699] VGAM2085 precursor RNA folds onto itself, forming VGAM2085 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[72700] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2085 folded precursor RNA into VGAM2085 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM2085 RNA is designated SEQ ID:4796, and is provided hereinbelow with reference to the sequence listing part.

[72701] VGAM2085 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2085 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2085 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72702] VGAM2085 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2085 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2085 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2085 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2085 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72703] The complementary binding of VGAM2085 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2085 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2085 host target RNA into VGAM2085 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72704] It is appreciated that VGAM2085 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2085 host target genes. The mRNA of each one of this plurality of VGAM2085 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2085 RNA, herein designated VGAM RNA, and which when bound by VGAM2085 RNA causes inhibition of translation of respective one or more VGAM2085 host target proteins.

[72705] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2085 gene, herein designated VGAM GENE, on one or more VGAM2085 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72706] It is yet further appreciated that a function of VGAM2085 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2085 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM2085 correlate with, and may be deduced from, the identity of the host target genes which VGAM2085 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72707] Nucleotide sequences of the VGAM2085 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2085 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2085 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2085 are further described hereinbelow with reference to Table 1.

[72708] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2085 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2085 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72709] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2085 gene, herein designated VGAM is inhibition of expression of VGAM2085 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2085 correlate with, and may be deduced from, the identity of the target genes which VGAM2085 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72710] Testis Specific Protein, Y-linked (TSPY, Accession XM_088755) is a VGAM2085 host target gene. TSPY BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TSPY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates

the complementarity of the nucleotide sequences of TSPY BINDING SITE, designated SEQ ID:39944, to the nucleotide sequence of VGAM2085 RNA, herein designated VGAM RNA, also designated SEQ ID:4796.

[72711] A function of VGAM2085 is therefore inhibition of Testis Specific Protein, Y-linked (TSPY, Accession XM_088755), a gene which may be involved in sperm differentiation. Accordingly, utilities of VGAM2085 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSPY. The function of TSPY has been established by previous studies. Schnieders et al. (1996) reported that TSPY gives rise to a pool of heterogeneously composed transcripts, at least 1 of which yields a protein that is a member of a superfamily including the protooncogene SET (OMIM Ref. No. 600960) and NAP1 (OMIM Ref. No. 164060), a nucleosome assembly factor. Immunohistological studies reported by Schnieders et al. (1996) revealed that TSPY is concentrated in the cytoplasm of spermatogonia in normal as well as in pathological tissue. They further reported that TSPY was found in the early forms of seminomatous testicular tumors. The authors suggested that TSPY function is related to spermatogonial proliferation in a phosphorylation-dependent

manner Lau (1999) discussed the possible role of the TSPY gene in gonadoblastoma (GBY; 424500) and in testicular and prostate cancers. His Figure 1 presented an updated map of genes assigned to the Y chromosome.

[72712] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[72713] Schnieders, F.; Dork, T.; Arnemann, J.; Vogel, T.; Werner, M.; Schmidtke, J. : Testis-specific protein, Y-encoded (TSPY) expression in testicular tissues. Hum. Molec. Genet. 5: 1801-1807, 1996. ; and

[72714] Lau, Y.-F. C. : Sex chromosome genetics '99: gonadoblastoma, testicular and prostate cancers, and the TSPY gene. Am. J. Hum. Genet. 64: 921-927, 1999.

[72715] Further studies establishing the function and utilities of TSPY are found in John Hopkins OMIM database record ID 480100, and in sited publications numbered 8307-8316 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Death-associated Protein Kinase 2 (DAPK2, Accession NM_014326) is another VGAM2085 host target gene. DAPK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DAPK2, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAPK2 BINDING SITE, designated SEQ ID:15631, to the nucleotide sequence of VGAM2085 RNA, herein designated VGAM RNA, also designated SEQ ID:4796.

[72716] Another function of VGAM2085 is therefore inhibition of Death-associated Protein Kinase 2 (DAPK2, Accession NM_014326). Accordingly, utilities of VGAM2085 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAPK2. LOC120856 (Accession XM_058509) is another VGAM2085 host target gene. LOC120856 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC120856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120856 BINDING SITE, designated SEQ ID:36630, to the nucleotide sequence of VGAM2085 RNA, herein designated VGAM RNA, also designated SEQ ID:4796.

[72717] Another function of VGAM2085 is therefore inhibition of LOC120856 (Accession XM_058509). Accordingly, utilities

of VGAM2085 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120856. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2086 (VGAM2086) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72718] VGAM2086 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2086 was detected is described hereinabove with reference to Figs. 1-8.

[72719] VGAM2086 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM2086 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72720] VGAM2086 gene encodes a VGAM2086 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2086 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2086 precursor RNA is designated SEQ ID:2072, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2072 is located at position 106213 relative to the genome of Fowlpox Virus.

[72721] VGAM2086 precursor RNA folds onto itself, forming VGAM2086 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72722] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2086 folded precursor RNA into VGAM2086 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2086 RNA is designated SEQ ID:4797, and

is provided hereinbelow with reference to the sequence listing part.

[72723] VGAM2086 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2086 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2086 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72724] VGAM2086 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2086 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2086 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2086 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2086 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72725] The complementary binding of VGAM2086 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2086 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2086 host target RNA into VGAM2086 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72726] It is appreciated that VGAM2086 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2086 host target genes. The mRNA of each one of this plurality of VGAM2086 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2086 RNA, herein designated VGAM RNA, and which when bound by VGAM2086 RNA causes inhibition of translation of respective one or more VGAM2086 host target proteins.

[72727] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2086 gene, herein designated VGAM GENE, on one or more VGAM2086 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72728] It is yet further appreciated that a function of VGAM2086 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2086 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM2086 correlate with, and may be deduced from, the identity of the host target genes which VGAM2086 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72729] Nucleotide sequences of the VGAM2086 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2086 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2086 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2086 are further described hereinbelow with reference to Table 1.

[72730] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2086 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2086 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72731] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2086 gene, herein designated VGAM is inhibition of expression of VGAM2086 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2086 correlate with, and may be deduced from, the identity of the target genes which VGAM2086 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72732] Brain and Acute Leukemia, Cytoplasmic (BAALC, Accession NM_024812) is a VGAM2086 host target gene. BAALC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BAALC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAALC BINDING SITE, designated SEQ ID:24194, to the nucleotide sequence of VGAM2086 RNA, herein designated VGAM RNA, also designated SEQ ID:4797.

[72733] A function of VGAM2086 is therefore inhibition of Brain and Acute Leukemia, Cytoplasmic (BAALC, Accession NM_024812). Accordingly, utilities of VGAM2086 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAALC. Neuronal Pentraxin I (NPTX1, Accession NM_002522) is another VGAM2086

host target gene. NPTX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NPTX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPTX1 BINDING SITE, designated SEQ ID:8358, to the nucleotide sequence of VGAM2086 RNA, herein designated VGAM RNA, also designated SEQ ID:4797.

[72734] Another function of VGAM2086 is therefore inhibition of Neuronal Pentraxin I (NPTX1, Accession NM_002522), a gene which may be involved in synaptic uptake of extracellular material and is very strongly similar to rat NP1. Accordingly, utilities of VGAM2086 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPTX1. The function of NPTX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM111.BART1 (Accession NM_012106) is another VGAM2086 host target gene. BART1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BART1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BART1 BINDING SITE, designated SEQ ID:14425, to the nucleotide sequence of VGAM2086 RNA, herein designated VGAM RNA, also designated SEQ ID:4797.

[72735] Another function of VGAM2086 is therefore inhibition of BART1 (Accession NM_012106). Accordingly, utilities of VGAM2086 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BART1. KIAA0871 (Accession NM_014961) is another VGAM2086 host target gene. KIAA0871 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0871 BINDING SITE, designated SEQ ID:17334, to the nucleotide sequence of VGAM2086 RNA, herein designated VGAM RNA, also designated SEQ ID:4797.

[72736] Another function of VGAM2086 is therefore inhibition of KIAA0871 (Accession NM_014961). Accordingly, utilities of VGAM2086 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0871. KIAA0984 (Accession XM_037557) is another VGAM2086 host target gene. KIAA0984 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0984, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0984 BINDING SITE, designated SEQ ID:32645, to the nucleotide sequence of VGAM2086 RNA, herein designated VGAM RNA, also designated SEQ ID:4797.

[72737] Another function of VGAM2086 is therefore inhibition of KIAA0984 (Accession XM_037557). Accordingly, utilities of VGAM2086 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0984. MGC11242 (Accession NM_024320) is another VGAM2086 host target gene. MGC11242 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC11242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11242 BINDING SITE, designated SEQ ID:23609, to

the nucleotide sequence of VGAM2086 RNA, herein designated VGAM RNA, also designated SEQ ID:4797.

[72738] Another function of VGAM2086 is therefore inhibition of MGC11242 (Accession NM_024320). Accordingly, utilities of VGAM2086 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11242. Synovial Sarcoma Translocation Gene On Chromosome 18-like 1 (SS18L1, Accession XM_037202) is another VGAM2086 host target gene. SS18L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SS18L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SS18L1 BINDING SITE, designated SEQ ID:32564, to the nucleotide sequence of VGAM2086 RNA, herein designated VGAM RNA, also designated SEQ ID:4797.

[72739] Another function of VGAM2086 is therefore inhibition of Synovial Sarcoma Translocation Gene On Chromosome 18-like 1 (SS18L1, Accession XM_037202). Accordingly, utilities of VGAM2086 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SS18L1. LOC134553 (Accession XM_059723) is an-

other VGAM2086 host target gene. LOC134553 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC134553, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134553 BINDING SITE, designated SEQ ID:37076, to the nucleotide sequence of VGAM2086 RNA, herein designated VGAM RNA, also designated SEQ ID:4797.

[72740] Another function of VGAM2086 is therefore inhibition of LOC134553 (Accession XM_059723). Accordingly, utilities of VGAM2086 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134553. LOC165552 (Accession XM_092666) is another VGAM2086 host target gene. LOC165552 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC165552, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165552 BINDING SITE, designated SEQ ID:40133, to the nucleotide sequence of VGAM2086 RNA, herein designated VGAM RNA, also designated SEQ ID:4797.

[72741] Another function of VGAM2086 is therefore inhibition of LOC165552 (Accession XM_092666). Accordingly, utilities of VGAM2086 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165552. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2087 (VGAM2087) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72742] VGAM2087 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2087 was detected is described hereinabove with reference to Figs. 1-8.

[72743] VGAM2087 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM2087 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72744] VGAM2087 gene encodes a VGAM2087 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2087 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2087 precursor RNA is designated SEQ ID:2073, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2073 is located at position 115039 relative to the genome of Fowlpox Virus.

[72745] VGAM2087 precursor RNA folds onto itself, forming VGAM2087 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72746] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2087 folded precursor RNA into VGAM2087 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 59%) nucleotide sequence of VGAM2087 RNA is designated SEQ ID:4798, and is provided hereinbelow with reference to the sequence listing part.

[72747] VGAM2087 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2087 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2087 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72748] VGAM2087 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2087 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2087 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2087 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2087 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72749] The complementary binding of VGAM2087 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2087 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2087 host target RNA into VGAM2087 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72750] It is appreciated that VGAM2087 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2087 host target genes. The mRNA of each one of this plurality of VGAM2087 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2087 RNA, herein designated VGAM RNA, and which when bound by VGAM2087 RNA causes inhibition of translation of respective one or more VGAM2087 host target proteins.

[72751] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2087 gene, herein designated VGAM GENE, on one or more VGAM2087 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72752] It is yet further appreciated that a function of VGAM2087 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM2087 correlate with, and may be deduced from, the identity of the host target genes which VGAM2087 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72753] Nucleotide sequences of the VGAM2087 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2087 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2087 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2087 are further described hereinbelow with reference to Table 1.

[72754] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2087 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2087 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[72755] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2087 gene, herein designated VGAM is inhibition of expression of VGAM2087 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2087 correlate with, and may be deduced from, the identity of the target genes which VGAM2087 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72756] AF3P21 (Accession NM_016453) is a VGAM2087 host target gene. AF3P21 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AF3P21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AF3P21 BINDING SITE, designated SEQ ID:18567, to the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, also designated SEQ ID:4798.

[72757] A function of VGAM2087 is therefore inhibition of AF3P21 (Accession NM_016453), a gene which has an important role in stress fiber formation induced by active diaphanous protein homolog 1 (drf1). Accordingly, utilities

of VGAM2087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AF3P21. The function of AF3P21 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1280.Glucagon-like Peptide 1 Receptor (GLP1R, Accession NM_002062) is another VGAM2087 host target gene. GLP1R BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GLP1R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLP1R BINDING SITE, designated SEQ ID:7827, to the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, also designated SEQ ID:4798.

[72758] Another function of VGAM2087 is therefore inhibition of Glucagon-like Peptide 1 Receptor (GLP1R, Accession NM_002062), a gene which is mediated by g proteins which activate adenylyl cyclase. Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLP1R. The function of GLP1R and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1652.G Protein-coupled Receptor 4 (GPR4, Accession XM_009140) is another VGAM2087 host target gene. GPR4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GPR4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR4 BINDING SITE, designated SEQ ID:30100, to the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, also designated SEQ ID:4798.

[72759] Another function of VGAM2087 is therefore inhibition of G Protein-coupled Receptor 4 (GPR4, Accession XM_009140), a gene which stimulates to produce increased calcium by both SPC and LPC . Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR4. The function of GPR4 has been established by previous studies. Many cell membrane receptors are members of the G protein-coupled receptor (GPR) family. GPRs are characterized by the presence of 7 transmembrane domains and numerous conserved amino acids. Us-

ing degenerate PCR, Heiber et al. (1995) identified additional members of this family. Among these was GPR4, which encodes a putative 355-amino acid protein and was selected from a genomic DNA library using the PCR-derived product as a probe. GPR4 shares the greatest sequence similarity with the human platelet-activating factor receptor (Ye et al., 1991). GPR4 is more than 50% identical to OGR1 (GPR68; 601404), a high-affinity receptor for the sphingosylphosphorylcholine (SPC) signaling molecule. Zhu et al. (2001) showed that cells expressing GPR4 are stimulated to produce increased calcium by both SPC and LPC (lysophosphatidylcholine), a ligand for G2A (OMIM Ref. No. 606167). RNA dot blot analysis revealed highest expression of GPR4 in ovary, liver, lung, kidney, lymph node, and subthalamic nucleus; in contrast, OGR1 is most highly expressed in lung, placenta, spleen, testis, small intestine, and peripheral blood leukocytes. Binding analysis determined that GPR4 interacts with SPC with high affinity and with LPC with lower affinity. Both ligands enhanced proliferation and ERK mitogen-activated protein kinase (see OMIM Ref. No. MAP3K4; 602425) activation in a GPR4-dependent and pertussis toxin (PTX)-sensitive manner, whereas ERK activation is PTX-insensitive in

OGR1-mediated signaling. Cell migration analysis suggested that both LPC and SPC enhance chemotaxis, but not chemokinesis, through GPR4.

[72760] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[72761] Heiber, M.; Docherty, J. M.; Shah, G.; Nguyen, T.; Cheng, R.; Heng, H. H. Q.; Marchese, A.; Tsui, L.-C.; Shi, X.; George, S. R.; O'Dowd, B. F. : Isolation of three novel human genes encoding G protein-coupled receptors. DNA Cell Biol. 14: 25-35, 1995. ; and

[72762] Zhu, K.; Baudhuin, L. M.; Hong, G.; Williams, F. S.; Cristina, K. L.; Kabarowski, J. H. S.; Witte, O. N.; Xu, Y. : Sphingosylphosphorylcholine and lysophosphatidylcholine are ligands f.

[72763] Further studies establishing the function and utilities of GPR4 are found in John Hopkins OMIM database record ID 600551, and in sited publications numbered 7874-787 and 7883 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Homeo Box D4 (HOXD4, Accession NM_014621) is another VGAM2087 host target gene. HOXD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by HOXD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXD4 BINDING SITE, designated SEQ ID:15979, to the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, also designated SEQ ID:4798.

[72764] Another function of VGAM2087 is therefore inhibition of Homeo Box D4 (HOXD4, Accession NM_014621), a gene which is part of a developmental regulatory system. Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXD4. The function of HOXD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM330.Baculoviral IAP Repeat-containing 3 (BIRC3, Accession XM_040715) is another VGAM2087 host target gene. BIRC3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BIRC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC3 BIND-

ING SITE, designated SEQ ID:33369, to the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, also designated SEQ ID:4798.

[72765] Another function of VGAM2087 is therefore inhibition of Baculoviral IAP Repeat-containing 3 (BIRC3, Accession XM_040715). Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC3. Doublecortin and CaM Kinase-like 1 (DCAMKL1, Accession NM_004734) is another VGAM2087 host target gene. DCAMKL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DCAMKL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCAMKL1 BINDING SITE, designated SEQ ID:11111, to the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, also designated SEQ ID:4798.

[72766] Another function of VGAM2087 is therefore inhibition of Doublecortin and CaM Kinase-like 1 (DCAMKL1, Accession NM_004734). Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCAMKL1. DKFZP434C212

(Accession XM_044196) is another VGAM2087 host target gene. DKFZP434C212 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434C212, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C212 BINDING SITE, designated SEQ ID:34171, to the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, also designated SEQ ID:4798.

[72767] Another function of VGAM2087 is therefore inhibition of DKFZP434C212 (Accession XM_044196). Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C212. FLJ14641 (Accession NM_032817) is another VGAM2087 host target gene. FLJ14641 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14641, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14641 BINDING SITE, designated SEQ ID:26592, to the nucleotide sequence of VGAM2087 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4798.

[72768] Another function of VGAM2087 is therefore inhibition of FLJ14641 (Accession NM_032817). Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14641. GDNF Family Receptor Alpha 4 (GFRA4, Accession NM_022139) is another VGAM2087 host target gene. GFRA4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GFRA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFRA4 BINDING SITE, designated SEQ ID:22702, to the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, also designated SEQ ID:4798.

[72769] Another function of VGAM2087 is therefore inhibition of GDNF Family Receptor Alpha 4 (GFRA4, Accession NM_022139). Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFRA4. KIAA0939 (Accession XM_030524) is another VGAM2087 host target gene. KIAA0939 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by KIAA0939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0939 BINDING SITE, designated SEQ ID:31057, to the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, also designated SEQ ID:4798.

[72770] Another function of VGAM2087 is therefore inhibition of KIAA0939 (Accession XM_030524). Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0939. KIAA0961 (Accession NM_014898) is another VGAM2087 host target gene. KIAA0961 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0961, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0961 BINDING SITE, designated SEQ ID:17076, to the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, also designated SEQ ID:4798.

[72771] Another function of VGAM2087 is therefore inhibition of

KIAA0961 (Accession NM_014898). Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0961. KIAA1054 (Accession XM_043493) is another VGAM2087 host target gene. KIAA1054 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:33956, to the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, also designated SEQ ID:4798.

[72772] Another function of VGAM2087 is therefore inhibition of KIAA1054 (Accession XM_043493). Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054. KIAA1297 (Accession XM_051005) is another VGAM2087 host target gene. KIAA1297 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1297 BINDING SITE, designated SEQ ID:35706, to the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, also designated SEQ ID:4798.

[72773] Another function of VGAM2087 is therefore inhibition of KIAA1297 (Accession XM_051005). Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1297. KIAA1854 (Accession XM_049884) is another VGAM2087 host target gene. KIAA1854 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1854 BINDING SITE, designated SEQ ID:35522, to the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, also designated SEQ ID:4798.

[72774] Another function of VGAM2087 is therefore inhibition of KIAA1854 (Accession XM_049884). Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1854. MGC10715 (Accession NM_024325) is another

VGAM2087 host target gene. MGC10715 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC10715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10715 BINDING SITE, designated SEQ ID:23612, to the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, also designated SEQ ID:4798.

[72775] Another function of VGAM2087 is therefore inhibition of MGC10715 (Accession NM_024325). Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10715. My015 (Accession XM_039512) is another VGAM2087 host target gene. My015 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by My015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of My015 BINDING SITE, designated SEQ ID:33104, to the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, also designated SEQ ID:4798.

[72776] Another function of VGAM2087 is therefore inhibition of My015 (Accession XM_039512). Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with My015. PRO2893 (Accession NM_018634) is another VGAM2087 host target gene. PRO2893 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO2893, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2893 BINDING SITE, designated SEQ ID:20706, to the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, also designated SEQ ID:4798.

[72777] Another function of VGAM2087 is therefore inhibition of PRO2893 (Accession NM_018634). Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2893. RNP24 (Accession NM_006815) is another VGAM2087 host target gene. RNP24 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNP24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNP24 BINDING SITE, designated SEQ ID:13693, to the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, also designated SEQ ID:4798.

[72778] Another function of VGAM2087 is therefore inhibition of RNP24 (Accession NM_006815). Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNP24. Trinucleotide Repeat Containing 9 (TNRC9, Accession XM_049037) is another VGAM2087 host target gene. TNRC9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNRC9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNRC9 BINDING SITE, designated SEQ ID:35319, to the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, also designated SEQ ID:4798.

[72779] Another function of VGAM2087 is therefore inhibition of Trinucleotide Repeat Containing 9 (TNRC9, Accession XM_049037). Accordingly, utilities of VGAM2087 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with TNRC9. LOC121838 (Accession XM_071772) is another VGAM2087 host target gene. LOC121838 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC121838, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121838 BINDING SITE, designated SEQ ID:37419, to the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, also designated SEQ ID:4798.

[72780] Another function of VGAM2087 is therefore inhibition of LOC121838 (Accession XM_071772). Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121838. LOC130814 (Accession XM_059471) is another VGAM2087 host target gene. LOC130814 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130814, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC130814 BINDING SITE, designated SEQ ID:37008, to the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, also designated SEQ ID:4798.

[72781] Another function of VGAM2087 is therefore inhibition of LOC130814 (Accession XM_059471). Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130814. LOC144845 (Accession NM_138474) is another VGAM2087 host target gene. LOC144845 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144845, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144845 BINDING SITE, designated SEQ ID:28824, to the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, also designated SEQ ID:4798.

[72782] Another function of VGAM2087 is therefore inhibition of LOC144845 (Accession NM_138474). Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144845. LOC93550 (Accession XM_051999) is another VGAM2087 host target gene. LOC93550 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93550, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93550 BINDING SITE, designated SEQ ID:35934, to the nucleotide sequence of VGAM2087 RNA, herein designated VGAM RNA, also designated SEQ ID:4798.

[72783] Another function of VGAM2087 is therefore inhibition of LOC93550 (Accession XM_051999). Accordingly, utilities of VGAM2087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93550. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2088 (VGAM2088) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72784] VGAM2088 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2088 was detected is described hereinabove with reference to Figs. 1-8.

[72785] VGAM2088 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM2088 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72786] VGAM2088 gene encodes a VGAM2088 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2088 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2088 precursor RNA is designated SEQ ID:2074, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2074 is located at position 97767 relative to the genome of Fowlpox Virus.

[72787] VGAM2088 precursor RNA folds onto itself, forming VGAM2088 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[72788] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2088 folded precursor RNA into VGAM2088 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2088 RNA is designated SEQ ID:4799, and is provided hereinbelow with reference to the sequence listing part.

[72789] VGAM2088 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2088 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2088 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72790] VGAM2088 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2088 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2088 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2088 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2088 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72791] The complementary binding of VGAM2088 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2088 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2088 host target RNA into VGAM2088 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72792] It is appreciated that VGAM2088 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2088 host target genes. The mRNA of each one of this plurality of VGAM2088 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2088 RNA, herein designated VGAM RNA, and which when bound by VGAM2088 RNA causes inhibition of translation of respective one or more VGAM2088 host target proteins.

[72793] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2088 gene, herein designated VGAM GENE, on one or more VGAM2088 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72794] It is yet further appreciated that a function of VGAM2088 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2088 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM2088 correlate with, and may be deduced from, the identity of the host target genes which VGAM2088 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72795] Nucleotide sequences of the VGAM2088 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2088 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2088 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2088 are further described hereinbelow with reference to Table 1.

[72796] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2088 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2088 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72797] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2088 gene, herein designated VGAM is inhibition of expression of VGAM2088 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2088 correlate with, and may be deduced from, the identity of the target genes which VGAM2088 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72798] IQ Motif Containing GTPase Activating Protein 2 (IQGAP2, Accession NM_006633) is a VGAM2088 host target gene. IQGAP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IQGAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of IQGAP2 BINDING SITE, designated SEQ ID:13428, to the nucleotide sequence of VGAM2088 RNA, herein designated VGAM RNA, also designated SEQ ID:4799.

[72799] A function of VGAM2088 is therefore inhibition of IQ Motif Containing GTPase Activating Protein 2 (IQGAP2, Accession NM_006633), a gene which Inhibits GTPase activity of Cdc42 and Rac1. Accordingly, utilities of VGAM2088 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IQGAP2. The function of IQGAP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM110.NCSTN (Accession XM_057331) is another VGAM2088 host target gene. NCSTN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NCSTN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCSTN BINDING SITE, designated SEQ ID:36509, to the nucleotide sequence of VGAM2088 RNA, herein designated VGAM RNA,

also designated SEQ ID:4799.

[72800] Another function of VGAM2088 is therefore inhibition of NCSTN (Accession XM_057331), a gene which has a central role in presenilin-mediated processing of beta-amyloid precursor protein (beta-APP, MIM 104760) and some aspects of notch (MIM 190198)/glp-1 signaling in vivo. Accordingly, utilities of VGAM2088 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCSTN. The function of NCSTN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM_004273) is another VGAM2088 host target gene. CHST3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHST3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST3 BINDING SITE, designated SEQ ID:10487, to the nucleotide sequence of VGAM2088 RNA, herein designated VGAM RNA, also designated SEQ ID:4799.

[72801] Another function of VGAM2088 is therefore inhibition of Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM_004273). Accordingly, utilities of VGAM2088 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST3. FLJ11577 (Accession NM_025159) is another VGAM2088 host target gene. FLJ11577 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11577 BINDING SITE, designated SEQ ID:24799, to the nucleotide sequence of VGAM2088 RNA, herein designated VGAM RNA, also designated SEQ ID:4799.

[72802] Another function of VGAM2088 is therefore inhibition of FLJ11577 (Accession NM_025159). Accordingly, utilities of VGAM2088 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11577. Fused Toes Homolog (mouse) (FTS, Accession NM_022476) is another VGAM2088 host target gene. FTS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FTS, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FTS BINDING SITE, designated SEQ ID:22844, to the nucleotide sequence of VGAM2088 RNA, herein designated VGAM RNA, also designated SEQ ID:4799.

[72803] Another function of VGAM2088 is therefore inhibition of Fused Toes Homolog (mouse) (FTS, Accession NM_022476). Accordingly, utilities of VGAM2088 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FTS. G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM_014776) is another VGAM2088 host target gene. GIT2 BINDING SITE1 through GIT2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GIT2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GIT2 BINDING SITE1 through GIT2 BINDING SITE3, designated SEQ ID:16607, SEQ ID:27689 and SEQ ID:27702 respectively, to the nucleotide sequence of VGAM2088 RNA, herein designated VGAM RNA, also designated SEQ ID:4799.

[72804] Another function of VGAM2088 is therefore inhibition of G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM_014776). Accordingly, utilities of VGAM2088 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GIT2. KIAA0478 (Accession NM_014870) is another VGAM2088 host target gene. KIAA0478 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0478 BINDING SITE, designated SEQ ID:16985, to the nucleotide sequence of VGAM2088 RNA, herein designated VGAM RNA, also designated SEQ ID:4799.

[72805] Another function of VGAM2088 is therefore inhibition of KIAA0478 (Accession NM_014870). Accordingly, utilities of VGAM2088 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0478. KIAA1681 (Accession XM_028059) is another VGAM2088 host target gene. KIAA1681 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1681, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1681 BINDING SITE, designated SEQ ID:30612, to the nucleotide sequence of VGAM2088 RNA, herein designated VGAM RNA, also designated SEQ ID:4799.

[72806] Another function of VGAM2088 is therefore inhibition of KIAA1681 (Accession XM_028059). Accordingly, utilities of VGAM2088 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1681. LOC153688 (Accession XM_098416) is another VGAM2088 host target gene. LOC153688 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153688 BINDING SITE, designated SEQ ID:41664, to the nucleotide sequence of VGAM2088 RNA, herein designated VGAM RNA, also designated SEQ ID:4799.

[72807] Another function of VGAM2088 is therefore inhibition of LOC153688 (Accession XM_098416). Accordingly, utilities of VGAM2088 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC153688. LOC200301 (Accession XM_114197) is another VGAM2088 host target gene. LOC200301 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200301 BINDING SITE, designated SEQ ID:42780, to the nucleotide sequence of VGAM2088 RNA, herein designated VGAM RNA, also designated SEQ ID:4799.

[72808] Another function of VGAM2088 is therefore inhibition of LOC200301 (Accession XM_114197). Accordingly, utilities of VGAM2088 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200301. LOC255458 (Accession XM_173150) is another VGAM2088 host target gene. LOC255458 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255458, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255458 BINDING SITE, designated SEQ ID:46408, to

the nucleotide sequence of VGAM2088 RNA, herein designated VGAM RNA, also designated SEQ ID:4799.

[72809] Another function of VGAM2088 is therefore inhibition of LOC255458 (Accession XM_173150). Accordingly, utilities of VGAM2088 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255458. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2089 (VGAM2089) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72810] VGAM2089 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2089 was detected is described hereinabove with reference to Figs. 1-8.

[72811] VGAM2089 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.
VGAM2089 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72812] VGAM2089 gene encodes a VGAM2089 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2089 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2089 precursor RNA is designated SEQ ID:2075, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2075 is located at position 103219 relative to the genome of Fowlpox Virus.

[72813] VGAM2089 precursor RNA folds onto itself, forming VGAM2089 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72814] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2089 folded precursor RNA into VGAM2089 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2089 RNA is designated SEQ ID:4800, and is provided hereinbelow with reference to the sequence listing part.

[72815] VGAM2089 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2089 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2089 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72816] VGAM2089 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2089 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2089 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2089 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2089 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72817] The complementary binding of VGAM2089 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2089 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2089 host target RNA into VGAM2089 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72818] It is appreciated that VGAM2089 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2089 host target genes. The mRNA of each one of this plurality of VGAM2089 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2089 RNA, herein designated VGAM RNA, and which when bound by VGAM2089 RNA causes inhibition of translation of respective one or more VGAM2089 host target proteins.

[72819] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2089 gene, herein designated VGAM GENE, on one or more VGAM2089 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72820] It is yet further appreciated that a function of VGAM2089 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2089 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM2089 correlate with, and may be deduced from, the identity of the host target genes which VGAM2089 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72821] Nucleotide sequences of the VGAM2089 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2089 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2089 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2089 are further described hereinbelow with reference to Table 1.

[72822] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2089 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2089 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72823] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2089 gene, herein designated VGAM is inhibition of expression of VGAM2089 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2089 correlate with, and may be deduced from, the identity of the target genes which VGAM2089 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72824] Protein Kinase, CGMP-dependent, Type I (PRKG1, Accession NM_006258) is a VGAM2089 host target gene. PRKG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRKG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKG1 BINDING SITE, designated SEQ ID:12936, to the nucleotide sequence of VGAM2089 RNA, herein designated VGAM RNA, also designated SEQ ID:4800.

[72825] A function of VGAM2089 is therefore inhibition of Protein Kinase, CGMP-dependent, Type I (PRKG1, Accession

NM_006258), a gene which relaxes vascular smooth muscle and inhibits platelet aggregation. Accordingly, utilities of VGAM2089 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKG1. The function of PRKG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1571.Asporin (LRR class 1) (ASPN, Accession NM_017680) is another VGAM2089 host target gene. ASPN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ASPN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASPN BINDING SITE, designated SEQ ID:19225, to the nucleotide sequence of VGAM2089 RNA, herein designated VGAM RNA, also designated SEQ ID:4800.

[72826] Another function of VGAM2089 is therefore inhibition of Asporin (LRR class 1) (ASPN, Accession NM_017680). Accordingly, utilities of VGAM2089 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASPN. DKFZp434A2417 (Accession XM_038526) is another VGAM2089 host target gene. DK-

FZp434A2417 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434A2417, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434A2417 BINDING SITE, designated SEQ ID:32863, to the nucleotide sequence of VGAM2089 RNA, herein designated VGAM RNA, also designated SEQ ID:4800.

[72827] Another function of VGAM2089 is therefore inhibition of DKFZp434A2417 (Accession XM_038526). Accordingly, utilities of VGAM2089 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434A2417. LOC257017 (Accession XM_173227) is another VGAM2089 host target gene. LOC257017 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257017 BINDING SITE, designated SEQ ID:46495, to the nucleotide sequence of VGAM2089 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4800.

[72828] Another function of VGAM2089 is therefore inhibition of LOC257017 (Accession XM_173227). Accordingly, utilities of VGAM2089 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257017. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2090 (VGAM2090) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72829] VGAM2090 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2090 was detected is described hereinabove with reference to Figs. 1-8.

[72830] VGAM2090 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM2090 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72831] VGAM2090 gene encodes a VGAM2090 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2090 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2090 precursor RNA is designated SEQ ID:2076, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2076 is located at position 110457 relative to the genome of Fowlpox Virus.

[72832] VGAM2090 precursor RNA folds onto itself, forming VGAM2090 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72833] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2090 folded precursor RNA into VGAM2090 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM2090 RNA is designated SEQ ID:4801, and is provided hereinbelow with reference to the sequence listing part.

[72834] VGAM2090 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2090 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2090 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72835] VGAM2090 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2090 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2090 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2090 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2090 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72836] The complementary binding of VGAM2090 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2090 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2090 host target RNA into VGAM2090 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72837] It is appreciated that VGAM2090 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2090 host target genes. The mRNA of

each one of this plurality of VGAM2090 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2090 RNA, herein designated VGAM RNA, and which when bound by VGAM2090 RNA causes inhibition of translation of respective one or more VGAM2090 host target proteins.

[72838] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2090 gene, herein designated VGAM GENE, on one or more VGAM2090 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[72839] It is yet further appreciated that a function of VGAM2090 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2090 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM2090 correlate with, and may be deduced from, the identity of the host target genes which VGAM2090 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72840] Nucleotide sequences of the VGAM2090 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2090 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2090 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2090 are further described hereinbelow with reference to Table 1.

[72841] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2090 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2090 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72842] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2090 gene, herein designated VGAM is inhibition of expression of VGAM2090 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2090 correlate with, and may be deduced from, the identity of the target genes which VGAM2090 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72843] Membrane Component, Chromosome 11, Surface Marker 1 (M11S1, Accession NM_005898) is a VGAM2090 host target gene. M11S1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by M11S1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of M11S1 BINDING SITE, designated SEQ ID:12515, to the nucleotide sequence of VGAM2090 RNA, herein designated VGAM RNA, also designated SEQ ID:4801.

[72844] A function of VGAM2090 is therefore inhibition of Membrane Component, Chromosome 11, Surface Marker 1

(M11S1, Accession NM_005898), a gene which may play a role in transporting nutrients from the gut lumen across the gutlining epithelial cell layer. Accordingly, utilities of VGAM2090 include diagnosis, prevention and treatment of diseases and clinical conditions associated with M11S1. The function of M11S1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM131.Meis1, Myeloid Ecotropic Viral Integration Site 1 Homolog 2 (mouse) (MEIS2, Accession NM_020149) is another VGAM2090 host target gene. MEIS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MEIS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEIS2 BINDING SITE, designated SEQ ID:21346, to the nucleotide sequence of VGAM2090 RNA, herein designated VGAM RNA, also designated SEQ ID:4801.

[72845] Another function of VGAM2090 is therefore inhibition of Meis1, Myeloid Ecotropic Viral Integration Site 1 Homolog 2 (mouse) (MEIS2, Accession NM_020149), a gene which may regulate gene expression and control cell differentia-

tion. Accordingly, utilities of VGAM2090 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEIS2. The function of MEIS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1244.Ribonucleotide Reductase M2 Polypeptide (RRM2, Accession NM_001034) is another VGAM2090 host target gene. RRM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RRM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RRM2 BINDING SITE, designated SEQ ID:6697, to the nucleotide sequence of VGAM2090 RNA, herein designated VGAM RNA, also designated SEQ ID:4801.

[72846] Another function of VGAM2090 is therefore inhibition of Ribonucleotide Reductase M2 Polypeptide (RRM2, Accession NM_001034). Accordingly, utilities of VGAM2090 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RRM2. Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 4

(SLC4A4, Accession NM_003759) is another VGAM2090 host target gene. SLC4A4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC4A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC4A4 BINDING SITE, designated SEQ ID:9836, to the nucleotide sequence of VGAM2090 RNA, herein designated VGAM RNA, also designated SEQ ID:4801.

[72847] Another function of VGAM2090 is therefore inhibition of Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 4 (SLC4A4, Accession NM_003759), a gene which is a sodium bicarbonate cotransporter. Accordingly, utilities of VGAM2090 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A4. The function of SLC4A4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM222.Chromosome 1 Open Reading Frame 22 (C1orf22, Accession NM_025191) is another VGAM2090 host target gene. C1orf22 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by C1orf22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf22 BINDING SITE, designated SEQ ID:24835, to the nucleotide sequence of VGAM2090 RNA, herein designated VGAM RNA, also designated SEQ ID:4801.

[72848] Another function of VGAM2090 is therefore inhibition of Chromosome 1 Open Reading Frame 22 (C1orf22, Accession NM_025191). Accordingly, utilities of VGAM2090 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf22. INSM2 (Accession NM_032594) is another VGAM2090 host target gene. INSM2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by INSM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INSM2 BINDING SITE, designated SEQ ID:26325, to the nucleotide sequence of VGAM2090 RNA, herein designated VGAM RNA, also designated SEQ ID:4801.

[72849] Another function of VGAM2090 is therefore inhibition of

INSM2 (Accession NM_032594). Accordingly, utilities of VGAM2090 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INSM2. KIAA0352 (Accession NM_014830) is another VGAM2090 host target gene. KIAA0352 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0352 BINDING SITE, designated SEQ ID:16821, to the nucleotide sequence of VGAM2090 RNA, herein designated VGAM RNA, also designated SEQ ID:4801.

[72850] Another function of VGAM2090 is therefore inhibition of KIAA0352 (Accession NM_014830). Accordingly, utilities of VGAM2090 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0352. PRO2730 (Accession NM_025222) is another VGAM2090 host target gene. PRO2730 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO2730, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of PRO2730 BINDING SITE, designated SEQ ID:24897, to the nucleotide sequence of VGAM2090 RNA, herein designated VGAM RNA, also designated SEQ ID:4801.

[72851] Another function of VGAM2090 is therefore inhibition of PRO2730 (Accession NM_025222). Accordingly, utilities of VGAM2090 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2730. Spir-1 (Accession XM_035640) is another VGAM2090 host target gene. Spir-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by Spir-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Spir-1 BINDING SITE, designated SEQ ID:32310, to the nucleotide sequence of VGAM2090 RNA, herein designated VGAM RNA, also designated SEQ ID:4801.

[72852] Another function of VGAM2090 is therefore inhibition of Spir-1 (Accession XM_035640). Accordingly, utilities of VGAM2090 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Spir-1. LOC253649 (Accession XM_171211) is another

VGAM2090 host target gene. LOC253649 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253649 BINDING SITE, designated SEQ ID:45998, to the nucleotide sequence of VGAM2090 RNA, herein designated VGAM RNA, also designated SEQ ID:4801.

[72853] Another function of VGAM2090 is therefore inhibition of LOC253649 (Accession XM_171211). Accordingly, utilities of VGAM2090 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253649. LOC253650 (Accession XM_171210) is another VGAM2090 host target gene. LOC253650 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253650 BINDING SITE, designated SEQ ID:45996, to the nucleotide sequence of VGAM2090 RNA, herein designated VGAM RNA, also designated SEQ ID:4801.

[72854] Another function of VGAM2090 is therefore inhibition of LOC253650 (Accession XM_171210). Accordingly, utilities of VGAM2090 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253650. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2091 (VGAM2091) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72855] VGAM2091 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2091 was detected is described hereinabove with reference to Figs. 1-8.

[72856] VGAM2091 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM2091 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72857] VGAM2091 gene encodes a VGAM2091 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2091 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2091 precursor RNA is designated SEQ ID:2077, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2077 is located at position 108768 relative to the genome of Fowlpox Virus.

[72858] VGAM2091 precursor RNA folds onto itself, forming VGAM2091 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72859] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2091 folded precursor RNA into VGAM2091 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2091 RNA is designated SEQ ID:4802, and is provided hereinbelow with reference to the sequence listing part.

[72860] VGAM2091 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2091 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2091 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72861] VGAM2091 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2091 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2091 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2091 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2091 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72862] The complementary binding of VGAM2091 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2091 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2091 host target RNA into VGAM2091 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72863] It is appreciated that VGAM2091 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2091 host target genes. The mRNA of each one of this plurality of VGAM2091 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2091 RNA, herein designated VGAM RNA, and which when bound by VGAM2091 RNA causes inhibition of translation of respective one or more VGAM2091 host target proteins.

[72864] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2091 gene, herein designated VGAM GENE, on one or more VGAM2091 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72865] It is yet further appreciated that a function of VGAM2091 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2091 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM2091 correlate with, and may be deduced from, the identity of the host target genes which VGAM2091 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72866] Nucleotide sequences of the VGAM2091 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2091 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2091 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2091 are further described hereinbelow with reference to Table 1.

[72867] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2091 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2091 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[72868] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2091 gene, herein designated VGAM is inhibition of expression of VGAM2091 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2091 correlate with, and may be deduced from, the identity of the target genes which VGAM2091 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72869] Fibroblast Growth Factor 7 (keratinocyte growth factor) (FGF7, Accession NM_002009) is a VGAM2091 host target gene. FGF7 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FGF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF7 BINDING SITE, designated SEQ ID:7746, to the nucleotide sequence of VGAM2091 RNA, herein designated VGAM RNA, also designated SEQ ID:4802.

[72870] A function of VGAM2091 is therefore inhibition of Fibroblast Growth Factor 7 (keratinocyte growth factor) (FGF7, Accession NM_002009), a gene which growth factor active on keratinocytes. Accordingly, utilities of VGAM2091 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF7. The function of FGF7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM678.Glutamate Decarboxylase 1 (brain, 67kDa) (GAD1, Accession NM_000817) is another VGAM2091 host target gene. GAD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GAD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAD1 BINDING SITE, designated SEQ ID:6477, to the nucleotide sequence of VGAM2091 RNA, herein designated VGAM RNA, also designated SEQ ID:4802.

[72871] Another function of VGAM2091 is therefore inhibition of Glutamate Decarboxylase 1 (brain, 67kDa) (GAD1, Accession NM_000817), a gene which catalyzes the conversion of glutamic acid to gamma-aminobutyric acid. Accordingly, utilities of VGAM2091 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAD1. The function of GAD1 and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM691.Surfeit 4 (SURF4, Accession NM_033161) is another VGAM2091 host target gene. SURF4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SURF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SURF4 BINDING SITE, designated SEQ ID:27013, to the nucleotide sequence of VGAM2091 RNA, herein designated VGAM RNA, also designated SEQ ID:4802.

[72872] Another function of VGAM2091 is therefore inhibition of Surfeit 4 (SURF4, Accession NM_033161), a gene which is a conserved integral membrane protein containing multiple putative transmembrane regions. Accordingly, utilities of VGAM2091 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SURF4. The function of SURF4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM496.KIAA1866 (Accession XM_027658)

is another VGAM2091 host target gene. KIAA1866 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1866, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1866 BINDING SITE, designated SEQ ID:30551, to the nucleotide sequence of VGAM2091 RNA, herein designated VGAM RNA, also designated SEQ ID:4802.

[72873] Another function of VGAM2091 is therefore inhibition of KIAA1866 (Accession XM_027658). Accordingly, utilities of VGAM2091 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1866. Regulator of G-protein Signalling 18 (RGS18, Accession NM_130782) is another VGAM2091 host target gene. RGS18 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RGS18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS18 BINDING SITE, designated SEQ ID:28271, to the nucleotide sequence of VGAM2091 RNA, herein designated VGAM RNA, also designated SEQ

ID:4802.

[72874] Another function of VGAM2091 is therefore inhibition of Regulator of G-protein Signalling 18 (RGS18, Accession NM_130782). Accordingly, utilities of VGAM2091 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS18. Zinc Finger Protein 237 (ZNF237, Accession NM_014242) is another VGAM2091 host target gene. ZNF237 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF237 BINDING SITE, designated SEQ ID:15503, to the nucleotide sequence of VGAM2091 RNA, herein designated VGAM RNA, also designated SEQ ID:4802.

[72875] Another function of VGAM2091 is therefore inhibition of Zinc Finger Protein 237 (ZNF237, Accession NM_014242). Accordingly, utilities of VGAM2091 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF237. LOC144874 (Accession XM_096696) is another VGAM2091 host target gene. LOC144874 BINDING SITE is HOST TARGET binding site

found in the 5` untranslated region of mRNA encoded by LOC144874, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144874 BINDING SITE, designated SEQ ID:40467, to the nucleotide sequence of VGAM2091 RNA, herein designated VGAM RNA, also designated SEQ ID:4802.

[72876] Another function of VGAM2091 is therefore inhibition of LOC144874 (Accession XM_096696). Accordingly, utilities of VGAM2091 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144874. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2092 (VGAM2092) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72877] VGAM2092 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2092 was detected is described hereinabove with reference to Figs. 1-8.

[72878] VGAM2092 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM2092 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72879] VGAM2092 gene encodes a VGAM2092 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2092 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2092 precursor RNA is designated SEQ ID:2078, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2078 is located at position 102276 relative to the genome of Fowlpox Virus.

[72880] VGAM2092 precursor RNA folds onto itself, forming VGAM2092 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[72881] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2092 folded precursor RNA into VGAM2092 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM2092 RNA is designated SEQ ID:4803, and is provided hereinbelow with reference to the sequence listing part.

[72882] VGAM2092 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2092 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2092 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72883] VGAM2092 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2092 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2092 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2092 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2092 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72884] The complementary binding of VGAM2092 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2092 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2092 host target RNA into VGAM2092 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72885] It is appreciated that VGAM2092 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2092 host target genes. The mRNA of each one of this plurality of VGAM2092 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2092 RNA, herein designated VGAM RNA, and which when bound by VGAM2092 RNA causes inhibition of translation of respective one or more VGAM2092 host target proteins.

[72886] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2092 gene, herein designated VGAM GENE, on one or more VGAM2092 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72887] It is yet further appreciated that a function of VGAM2092 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2092 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM2092 correlate with, and may be deduced from, the identity of the host target genes which VGAM2092 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72888] Nucleotide sequences of the VGAM2092 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2092 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2092 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2092 are further described hereinbelow with reference to Table 1.

[72889] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2092 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2092 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72890] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2092 gene, herein designated VGAM is inhibition of expression of VGAM2092 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2092 correlate with, and may be deduced from, the identity of the target genes which VGAM2092 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72891] TEM8 (Accession NM_032208) is a VGAM2092 host target gene. TEM8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TEM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of TEM8 BINDING SITE, designated SEQ ID:25920, to the nucleotide sequence of VGAM2092 RNA, herein designated VGAM RNA, also designated SEQ ID:4803.

[72892] A function of VGAM2092 is therefore inhibition of TEM8 (Accession NM_032208), a gene which is a tumor-specific endothelial marker. Accordingly, utilities of VGAM2092 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEM8. The function of TEM8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1489.FLJ10458 (Accession NM_018096) is another VGAM2092 host target gene. FLJ10458 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10458, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10458 BINDING SITE, designated SEQ ID:19867, to the nucleotide sequence of VGAM2092 RNA, herein designated VGAM RNA, also designated SEQ ID:4803.

[72893] Another function of VGAM2092 is therefore inhibition of FLJ10458 (Accession NM_018096). Accordingly, utilities of

VGAM2092 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10458. KIAA0478 (Accession NM_014870) is another VGAM2092 host target gene. KIAA0478 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0478 BINDING SITE, designated SEQ ID:16987, to the nucleotide sequence of VGAM2092 RNA, herein designated VGAM RNA, also designated SEQ ID:4803.

[72894] Another function of VGAM2092 is therefore inhibition of KIAA0478 (Accession NM_014870). Accordingly, utilities of VGAM2092 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0478. ZW10 Interactor (ZWINT, Accession NM_032997) is another VGAM2092 host target gene. ZWINT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZWINT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of ZWINT BINDING SITE, designated SEQ ID:26877, to the nucleotide sequence of VGAM2092 RNA, herein designated VGAM RNA, also designated SEQ ID:4803.

[72895] Another function of VGAM2092 is therefore inhibition of ZW10 Interactor (ZWINT, Accession NM_032997). Accordingly, utilities of VGAM2092 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZWINT. LOC144231 (Accession XM_096561) is another VGAM2092 host target gene. LOC144231 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144231 BINDING SITE, designated SEQ ID:40395, to the nucleotide sequence of VGAM2092 RNA, herein designated VGAM RNA, also designated SEQ ID:4803.

[72896] Another function of VGAM2092 is therefore inhibition of LOC144231 (Accession XM_096561). Accordingly, utilities of VGAM2092 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144231. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2093 (VGAM2093) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72897] VGAM2093 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2093 was detected is described hereinabove with reference to Figs. 1-8.

[72898] VGAM2093 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM2093 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72899] VGAM2093 gene encodes a VGAM2093 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2093 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2093 precursor RNA is designated SEQ ID:2079, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2079 is located at position 164255 relative to the genome of Camelpox Virus.

[72900] VGAM2093 precursor RNA folds onto itself, forming VGAM2093 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72901] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2093 folded precursor RNA into VGAM2093 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2093 RNA is designated SEQ ID:4804, and is provided hereinbelow with reference to the sequence listing part.

[72902] VGAM2093 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2093 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2093 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72903] VGAM2093 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2093 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2093 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2093 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2093 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72904] The complementary binding of VGAM2093 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2093 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2093 host target RNA into VGAM2093 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72905] It is appreciated that VGAM2093 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2093 host target genes. The mRNA of each one of this plurality of VGAM2093 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2093 RNA, herein designated VGAM RNA, and which when bound by VGAM2093 RNA causes inhibition of translation of respective one or more

VGAM2093 host target proteins.

[72906] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2093 gene, herein designated VGAM GENE, on one or more VGAM2093 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72907] It is yet further appreciated that a function of VGAM2093 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2093 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific

functions, and accordingly utilities, of VGAM2093 correlate with, and may be deduced from, the identity of the host target genes which VGAM2093 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72908] Nucleotide sequences of the VGAM2093 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2093 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2093 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2093 are further described hereinbelow with reference to Table 1.

[72909] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2093 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2093 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72910] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2093 gene, herein designated VGAM is inhibition of expression of VGAM2093 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2093 correlate with, and may be deduced from, the identity of the target genes which VGAM2093 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72911] Adaptor-related Protein Complex 1, Sigma 2 Subunit (AP1S2, Accession NM_003916) is a VGAM2093 host target gene. AP1S2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AP1S2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP1S2 BINDING SITE, designated SEQ ID:9999, to the nucleotide sequence of VGAM2093 RNA, herein designated VGAM RNA, also designated SEQ ID:4804.

[72912] A function of VGAM2093 is therefore inhibition of Adaptor-related Protein Complex 1, Sigma 2 Subunit (AP1S2, Accession NM_003916). Accordingly, utilities of VGAM2093 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1S2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger

2094 (VGAM2094) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72913] VGAM2094 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2094 was detected is described hereinabove with reference to Figs. 1-8.

[72914] VGAM2094 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM2094 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72915] VGAM2094 gene encodes a VGAM2094 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2094 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2094 precursor RNA is designated SEQ ID:2080, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2080 is located at position 169679 relative to the genome of Camelpox Virus.

[72916] VGAM2094 precursor RNA folds onto itself, forming

VGAM2094 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72917] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2094 folded precursor RNA into VGAM2094 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM2094 RNA is designated SEQ ID:4805, and is provided hereinbelow with reference to the sequence listing part.

[72918] VGAM2094 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2094 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2094 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72919] VGAM2094 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2094 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2094 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2094 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2094 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72920] The complementary binding of VGAM2094 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2094 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2094 host target RNA into VGAM2094 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72921] It is appreciated that VGAM2094 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2094 host target genes. The mRNA of each one of this plurality of VGAM2094 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2094 RNA, herein designated VGAM RNA, and which when bound by VGAM2094 RNA causes inhibition of translation of respective one or more VGAM2094 host target proteins.

[72922] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2094 gene, herein designated VGAM GENE, on one or more VGAM2094 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72923] It is yet further appreciated that a function of VGAM2094 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2094 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM2094 correlate with, and may be deduced from, the identity of the host target genes which VGAM2094 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[72924] Nucleotide sequences of the VGAM2094 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2094 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2094 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2094 are further described hereinbelow with reference to Table 1.

[72925] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2094 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2094 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72926] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2094 gene, herein designated VGAM is inhibition of expression of VGAM2094 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2094 correlate with, and may be deduced from, the identity of the target genes which VGAM2094 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[72927] GM2 Ganglioside Activator Protein (GM2A, Accession XM_041978) is a VGAM2094 host target gene. GM2A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GM2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GM2A BINDING SITE, designated SEQ ID:33658, to the nucleotide sequence of VGAM2094 RNA, herein designated VGAM RNA, also designated SEQ ID:4805.

[72928] A function of VGAM2094 is therefore inhibition of GM2 Ganglioside Activator Protein (GM2A, Accession XM_041978). Accordingly, utilities of VGAM2094 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GM2A. Lymphocyte Cytosolic Protein 1 (L-plastin) (LCP1, Accession NM_002298) is another VGAM2094 host target gene. LCP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LCP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LCP1 BINDING

SITE, designated SEQ ID:8081, to the nucleotide sequence of VGAM2094 RNA, herein designated VGAM RNA, also designated SEQ ID:4805.

[72929] Another function of VGAM2094 is therefore inhibition of Lymphocyte Cytosolic Protein 1 (L-plastin) (LCP1, Accession NM_002298), a gene which is involved in t cell antigen receptor mediated signaling. Accordingly, utilities of VGAM2094 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LCP1. The function of LCP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM418.Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 5 (RPS6KA5, Accession NM_004755) is another VGAM2094 host target gene. RPS6KA5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RPS6KA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPS6KA5 BINDING SITE, designated SEQ ID:11142, to the nucleotide sequence of VGAM2094 RNA, herein designated VGAM RNA, also designated SEQ ID:4805.

[72930] Another function of VGAM2094 is therefore inhibition of Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 5 (RPS6KA5, Accession NM_004755), a gene which plays an essential role in the proliferation of yeast cells. Accordingly, utilities of VGAM2094 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS6KA5. The function of RPS6KA5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191.Tumor Protein P63 (TP63, Accession NM_003722) is another VGAM2094 host target gene. TP63 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TP63, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP63 BINDING SITE, designated SEQ ID:9814, to the nucleotide sequence of VGAM2094 RNA, herein designated VGAM RNA, also designated SEQ ID:4805.

[72931] Another function of VGAM2094 is therefore inhibition of Tumor Protein P63 (TP63, Accession NM_003722). Accordingly, utilities of VGAM2094 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with TP63. Vacuolar Protein Sorting 41 (yeast) (VPS41, Accession NM_014396) is another VGAM2094 host target gene. VPS41 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VPS41, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS41 BINDING SITE, designated SEQ ID:15737, to the nucleotide sequence of VGAM2094 RNA, herein designated VGAM RNA, also designated SEQ ID:4805.

[72932] Another function of VGAM2094 is therefore inhibition of Vacuolar Protein Sorting 41 (yeast) (VPS41, Accession NM_014396). Accordingly, utilities of VGAM2094 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS41. KIAA0766 (Accession NM_014805) is another VGAM2094 host target gene. KIAA0766 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0766 BINDING SITE, designated

SEQ ID:16740, to the nucleotide sequence of VGAM2094 RNA, herein designated VGAM RNA, also designated SEQ ID:4805.

[72933] Another function of VGAM2094 is therefore inhibition of KIAA0766 (Accession NM_014805). Accordingly, utilities of VGAM2094 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0766. Paternally Expressed 10 (PEG10, Accession NM_015068) is another VGAM2094 host target gene. PEG10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PEG10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEG10 BINDING SITE, designated SEQ ID:17422, to the nucleotide sequence of VGAM2094 RNA, herein designated VGAM RNA, also designated SEQ ID:4805.

[72934] Another function of VGAM2094 is therefore inhibition of Paternally Expressed 10 (PEG10, Accession NM_015068). Accordingly, utilities of VGAM2094 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEG10. LOC146506 (Accession

XM_085489) is another VGAM2094 host target gene. LOC146506 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146506, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146506 BINDING SITE, designated SEQ ID:38177, to the nucleotide sequence of VGAM2094 RNA, herein designated VGAM RNA, also designated SEQ ID:4805.

[72935] Another function of VGAM2094 is therefore inhibition of LOC146506 (Accession XM_085489). Accordingly, utilities of VGAM2094 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146506. LOC149301 (Accession XM_086480) is another VGAM2094 host target gene. LOC149301 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149301 BINDING SITE, designated SEQ ID:38689, to the nucleotide sequence of VGAM2094 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4805.

[72936] Another function of VGAM2094 is therefore inhibition of LOC149301 (Accession XM_086480). Accordingly, utilities of VGAM2094 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149301. LOC153525 (Accession XM_098383) is another VGAM2094 host target gene. LOC153525 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153525, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153525 BINDING SITE, designated SEQ ID:41637, to the nucleotide sequence of VGAM2094 RNA, herein designated VGAM RNA, also designated SEQ ID:4805.

[72937] Another function of VGAM2094 is therefore inhibition of LOC153525 (Accession XM_098383). Accordingly, utilities of VGAM2094 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153525. LOC255520 (Accession XM_171073) is another VGAM2094 host target gene. LOC255520 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255520, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255520 BINDING SITE, designated SEQ ID:45878, to the nucleotide sequence of VGAM2094 RNA, herein designated VGAM RNA, also designated SEQ ID:4805.

[72938] Another function of VGAM2094 is therefore inhibition of LOC255520 (Accession XM_171073). Accordingly, utilities of VGAM2094 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255520. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2095 (VGAM2095) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72939] VGAM2095 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2095 was detected is described hereinabove with reference to Figs. 1-8.

[72940] VGAM2095 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus.

VGAM2095 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72941] VGAM2095 gene encodes a VGAM2095 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2095 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2095 precursor RNA is designated SEQ ID:2081, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2081 is located at position 174432 relative to the genome of Camelpox Virus.

[72942] VGAM2095 precursor RNA folds onto itself, forming VGAM2095 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72943] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM2095 folded precursor RNA into VGAM2095 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2095 RNA is designated SEQ ID:4806, and is provided hereinbelow with reference to the sequence listing part.

[72944] VGAM2095 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2095 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2095 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72945] VGAM2095 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2095 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2095 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2095 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2095 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72946] The complementary binding of VGAM2095 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2095 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2095 host target RNA into VGAM2095 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72947] It is appreciated that VGAM2095 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2095 host target genes. The mRNA of each one of this plurality of VGAM2095 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2095 RNA, herein designated VGAM RNA, and which when bound by VGAM2095 RNA causes inhibition of translation of respective one or more VGAM2095 host target proteins.

[72948] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2095 gene, herein designated VGAM GENE, on one or more VGAM2095 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72949] It is yet further appreciated that a function of VGAM2095 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2095 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM2095 correlate with, and may be deduced from, the identity of the host target genes which VGAM2095 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72950] Nucleotide sequences of the VGAM2095 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2095 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2095 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2095 are further described hereinbelow with reference to Table 1.

[72951] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2095 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2095 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72952] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2095 gene, herein designated VGAM is inhibition of expression of VGAM2095 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2095 correlate with, and may be deduced from, the identity of the target genes which VGAM2095 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72953] V-kit Hardy-Zuckerman 4 Feline Sarcoma Viral Oncogene Homolog (KIT, Accession NM_000222) is a VGAM2095 host target gene. KIT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIT BINDING SITE, designated SEQ

ID:5732, to the nucleotide sequence of VGAM2095 RNA, herein designated VGAM RNA, also designated SEQ ID:4806.

[72954] A function of VGAM2095 is therefore inhibition of V-kit Hardy-Zuckerman 4 Feline Sarcoma Viral Oncogene Homolog (KIT, Accession NM_000222), a gene which is the receptor for stem cell factor (mast cell growth factor) and has a tyrosine-protein kinase activity. Accordingly, utilities of VGAM2095 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIT. The function of KIT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173.Pumilio Homolog 2 (Drosophila) (PUM2, Accession NM_015317) is another VGAM2095 host target gene. PUM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PUM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PUM2 BINDING SITE, designated SEQ ID:17634, to the nucleotide sequence of VGAM2095 RNA, herein designated VGAM RNA, also designated SEQ ID:4806.

[72955] Another function of VGAM2095 is therefore inhibition of Pumilio Homolog 2 (Drosophila) (PUM2, Accession NM_015317). Accordingly, utilities of VGAM2095 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PUM2. Solute Carrier Family 25, Member 13 (citrin) (SLC25A13, Accession NM_014251) is another VGAM2095 host target gene. SLC25A13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC25A13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC25A13 BINDING SITE, designated SEQ ID:15523, to the nucleotide sequence of VGAM2095 RNA, herein designated VGAM RNA, also designated SEQ ID:4806.

[72956] Another function of VGAM2095 is therefore inhibition of Solute Carrier Family 25, Member 13 (citrin) (SLC25A13, Accession NM_014251). Accordingly, utilities of VGAM2095 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC25A13. START Domain Containing 5 (STARD5, Accession NM_030574) is another VGAM2095 host target gene. STARD5 BINDING SITE is HOST TARGET binding site found

in the 5` untranslated region of mRNA encoded by STARD5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STARD5 BINDING SITE, designated SEQ ID:24947, to the nucleotide sequence of VGAM2095 RNA, herein designated VGAM RNA, also designated SEQ ID:4806.

[72957] Another function of VGAM2095 is therefore inhibition of START Domain Containing 5 (STARD5, Accession NM_030574). Accordingly, utilities of VGAM2095 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STARD5. Transmembrane Protein 1 (TMEM1, Accession NM_003274) is another VGAM2095 host target gene. TMEM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TMEM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMEM1 BINDING SITE, designated SEQ ID:9287, to the nucleotide sequence of VGAM2095 RNA, herein designated VGAM RNA, also designated SEQ ID:4806.

[72958] Another function of VGAM2095 is therefore inhibition of Transmembrane Protein 1 (TMEM1, Accession NM_003274). Accordingly, utilities of VGAM2095 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMEM1. BC022889 (Accession XM_096964) is another VGAM2095 host target gene. BC022889 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BC022889, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BC022889 BINDING SITE, designated SEQ ID:40682, to the nucleotide sequence of VGAM2095 RNA, herein designated VGAM RNA, also designated SEQ ID:4806.

[72959] Another function of VGAM2095 is therefore inhibition of BC022889 (Accession XM_096964). Accordingly, utilities of VGAM2095 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BC022889. Chromosome 22 Open Reading Frame 19 (C22orf19, Accession NM_003678) is another VGAM2095 host target gene. C22orf19 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by C22orf19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C22orf19 BINDING SITE, designated SEQ ID:9771, to the nucleotide sequence of VGAM2095 RNA, herein designated VGAM RNA, also designated SEQ ID:4806.

[72960] Another function of VGAM2095 is therefore inhibition of Chromosome 22 Open Reading Frame 19 (C22orf19, Accession NM_003678). Accordingly, utilities of VGAM2095 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf19. DKFZp761D221 (Accession NM_032291) is another VGAM2095 host target gene. DKFZp761D221 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp761D221, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761D221 BINDING SITE, designated SEQ ID:26055, to the nucleotide sequence of VGAM2095 RNA, herein designated VGAM RNA, also designated SEQ ID:4806.

[72961] Another function of VGAM2095 is therefore inhibition of DKFZp761D221 (Accession NM_032291). Accordingly, utilities of VGAM2095 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761D221. DKFZP761G1913 (Accession NM_031474) is another VGAM2095 host target gene. DKFZP761G1913 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP761G1913, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP761G1913 BINDING SITE, designated SEQ ID:25544, to the nucleotide sequence of VGAM2095 RNA, herein designated VGAM RNA, also designated SEQ ID:4806.

[72962] Another function of VGAM2095 is therefore inhibition of DKFZP761G1913 (Accession NM_031474). Accordingly, utilities of VGAM2095 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761G1913. FLJ10706 (Accession NM_018186) is another VGAM2095 host target gene. FLJ10706 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10706, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10706 BINDING SITE, designated SEQ ID:20037, to the nucleotide sequence of VGAM2095 RNA, herein designated VGAM RNA, also designated SEQ ID:4806.

[72963] Another function of VGAM2095 is therefore inhibition of FLJ10706 (Accession NM_018186). Accordingly, utilities of VGAM2095 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10706. Hydroxysteroid (17-beta) Dehydrogenase 12 (HSD17B12, Accession NM_016142) is another VGAM2095 host target gene. HSD17B12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSD17B12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSD17B12 BINDING SITE, designated SEQ ID:18226, to the nucleotide sequence of VGAM2095 RNA, herein designated VGAM RNA, also designated SEQ ID:4806.

[72964] Another function of VGAM2095 is therefore inhibition of Hydroxysteroid (17-beta) Dehydrogenase 12 (HSD17B12,

Accession NM_016142). Accordingly, utilities of VGAM2095 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSD17B12. KIAA1078 (Accession XM_036589) is another VGAM2095 host target gene. KIAA1078 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1078 BINDING SITE, designated SEQ ID:32470, to the nucleotide sequence of VGAM2095 RNA, herein designated VGAM RNA, also designated SEQ ID:4806.

[72965] Another function of VGAM2095 is therefore inhibition of KIAA1078 (Accession XM_036589). Accordingly, utilities of VGAM2095 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1078. SEC24 Related Gene Family, Member D (S. cerevisiae) (SEC24D, Accession NM_014822) is another VGAM2095 host target gene. SEC24D BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SEC24D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC24D BINDING SITE, designated SEQ ID:16800, to the nucleotide sequence of VGAM2095 RNA, herein designated VGAM RNA, also designated SEQ ID:4806.

[72966] Another function of VGAM2095 is therefore inhibition of SEC24 Related Gene Family, Member D (S. cerevisiae) (SEC24D, Accession NM_014822). Accordingly, utilities of VGAM2095 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC24D. LOC158428 (Accession XM_047249) is another VGAM2095 host target gene. LOC158428 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158428 BINDING SITE, designated SEQ ID:34921, to the nucleotide sequence of VGAM2095 RNA, herein designated VGAM RNA, also designated SEQ ID:4806.

[72967] Another function of VGAM2095 is therefore inhibition of LOC158428 (Accession XM_047249). Accordingly, utilities of VGAM2095 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC158428. LOC257428 (Accession XM_168584) is another VGAM2095 host target gene. LOC257428 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257428 BINDING SITE, designated SEQ ID:45262, to the nucleotide sequence of VGAM2095 RNA, herein designated VGAM RNA, also designated SEQ ID:4806.

[72968] Another function of VGAM2095 is therefore inhibition of LOC257428 (Accession XM_168584). Accordingly, utilities of VGAM2095 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257428. LOC91549 (Accession XM_039115) is another VGAM2095 host target gene. LOC91549 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91549 BINDING SITE, designated SEQ ID:33014, to the

nucleotide sequence of VGAM2095 RNA, herein designated VGAM RNA, also designated SEQ ID:4806.

[72969] Another function of VGAM2095 is therefore inhibition of LOC91549 (Accession XM_039115). Accordingly, utilities of VGAM2095 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91549. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2096 (VGAM2096) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72970] VGAM2096 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2096 was detected is described hereinabove with reference to Figs. 1-8.

[72971] VGAM2096 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM2096 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72972] VGAM2096 gene encodes a VGAM2096 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2096 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2096 precursor RNA is designated SEQ ID:2082, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2082 is located at position 170764 relative to the genome of Camelpox Virus.

[72973] VGAM2096 precursor RNA folds onto itself, forming VGAM2096 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72974] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2096 folded precursor RNA into VGAM2096 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM2096 RNA is designated SEQ ID:4807, and is provided hereinbelow with reference to the sequence listing part.

[72975] VGAM2096 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2096 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2096 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72976] VGAM2096 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2096 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2096 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2096 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2096 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72977] The complementary binding of VGAM2096 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2096 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2096 host target RNA into VGAM2096 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72978] It is appreciated that VGAM2096 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2096 host target genes. The mRNA of each one of this plurality of VGAM2096 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2096 RNA, herein designated VGAM RNA, and which when bound by VGAM2096 RNA causes inhibition of translation of respective one or more VGAM2096 host target proteins.

[72979] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2096 gene, herein designated VGAM GENE, on one or more VGAM2096 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72980] It is yet further appreciated that a function of VGAM2096 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2096 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM2096 correlate with, and may be deduced from, the identity of the host target genes which VGAM2096 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72981] Nucleotide sequences of the VGAM2096 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2096 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2096 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2096 are further described hereinbelow with reference to Table 1.

[72982] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2096 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2096 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72983] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2096 gene, herein designated VGAM is inhibition of expression of VGAM2096 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2096 correlate with, and may be deduced from, the identity of the target genes which VGAM2096 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[72984] LEC3 (Accession NM_015236) is a VGAM2096 host target gene. LEC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LEC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEC3 BINDING SITE, designated SEQ ID:17574, to the nucleotide sequence of VGAM2096 RNA, herein designated VGAM RNA, also designated SEQ ID:4807.

[72985] A function of VGAM2096 is therefore inhibition of LEC3 (Accession NM_015236). Accordingly, utilities of VGAM2096 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LEC3. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2097 (VGAM2097) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[72986] VGAM2097 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2097 was detected is described hereinabove with reference to Figs. 1-8.

[72987] VGAM2097 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM2097 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[72988] VGAM2097 gene encodes a VGAM2097 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2097 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2097 precursor RNA is designated SEQ ID:2083, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2083 is located at position 176879 relative to the genome of Camelpox Virus.

[72989] VGAM2097 precursor RNA folds onto itself, forming VGAM2097 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[72990] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2097 folded precursor RNA into VGAM2097 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 68%) nucleotide sequence of VGAM2097 RNA is designated SEQ ID:4808, and is provided hereinbelow with reference to the sequence listing part.

[72991] VGAM2097 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2097 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2097 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[72992] VGAM2097 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2097 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2097 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2097 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2097 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[72993] The complementary binding of VGAM2097 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2097 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2097 host target RNA into VGAM2097 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[72994] It is appreciated that VGAM2097 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2097 host target genes. The mRNA of each one of this plurality of VGAM2097 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2097 RNA, herein designated VGAM RNA, and which when bound by VGAM2097 RNA causes

inhibition of translation of respective one or more VGAM2097 host target proteins.

[72995] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2097 gene, herein designated VGAM GENE, on one or more VGAM2097 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[72996] It is yet further appreciated that a function of VGAM2097 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2097 include diagnosis, prevention and

treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM2097 correlate with, and may be deduced from, the identity of the host target genes which VGAM2097 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[72997] Nucleotide sequences of the VGAM2097 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2097 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2097 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2097 are further described hereinbelow with reference to Table 1.

[72998] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2097 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2097 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[72999] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2097 gene, herein designated VGAM is inhibition of expression of VGAM2097 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2097 correlate with, and may be deduced from, the identity of the target genes which VGAM2097 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73000] Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, Drosophila) (PDE4D, Accession XM_056815) is a VGAM2097 host target gene. PDE4D BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE4D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4D BINDING SITE, designated SEQ ID:36438, to the nucleotide sequence of VGAM2097 RNA, herein designated VGAM RNA, also designated SEQ ID:4808.

[73001] A function of VGAM2097 is therefore inhibition of Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, Drosophila) (PDE4D, Accession XM_056815), a gene which has similarity to Drosophila dnc, which is the affected protein in learning and memory mutant dunce. Accordingly, utilities of VGAM2097 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with PDE4D. The function of PDE4D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180.Trophinin (TRO, Accession NM_016157) is another VGAM2097 host target gene. TRO BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TRO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRO BINDING SITE, designated SEQ ID:18247, to the nucleotide sequence of VGAM2097 RNA, herein designated VGAM RNA, also designated SEQ ID:4808.

[73002] Another function of VGAM2097 is therefore inhibition of Trophinin (TRO, Accession NM_016157), a gene which functions as an adhesion molecule. Accordingly, utilities of VGAM2097 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRO. The function of TRO has been established by previous studies. The initial attachment of the trophoblast to the endometrial epithelium during implantation occurs via the apical cell membranes of the embryonic and maternal

cells. Fukuda et al. (1995) found that cells from HT-H, a trophoblastic teratocarcinoma cell line, adhered efficiently to cells from SNG-M, an endometrial adenocarcinoma cell line. The adhesion was homophilic and cell type-specific, and occurred at the respective upper cell surfaces. To identify the adhesion molecules, the authors screened an HT-H expression library in COS-1 cells. They found that expression of 2 distinct cDNAs, encoding trophinin (cloned from trophoblastic cells) and tastin (OMIM Ref. No. 603872), was necessary for adhesion. The deduced 749-amino acid trophinin protein contains 69 tandem repeats of decapeptide sequences. In vitro translated trophinin has a molecular mass of 61 kD. Sequence and structural analyses revealed that trophinin is an intrinsic plasma membrane protein with 8 predicted transmembrane domains, an intracellular N-terminal region, and 3 hydrophilic regions exposed on the cell surface. COS-1 cells expressing trophinin and tastin aggregated in suspension, and soluble peptides of the cell surface domain of trophinin bound to the cell surface of trophinin-expressing cells. Northern blot analysis detected trophinin expression as 3.5-, 7.5-, and 10-kb mRNAs in both HT-H and SNG-M cells. However, neither trophinin nor tastin

was expressed in various other human cell types tested, with the exception of macrophages. Using immunofluorescence, Fukuda et al. (1995) detected strong expression of both genes in the trophectoderm surface of monkey blastocysts, as well as in human endometrial surface epithelium at a time consistent with that expected for the 'implantation window.' These authors suggested that trophinin and tastin might mediate the adhesion of the blastocyst to the endometrial epithelium at the time of implantation. Using immunohistochemistry, Suzuki et al. (1999) determined that trophinin and bystin (OMIM Ref. No. 603871), a trophinin- and tastin-binding protein, were found in the placenta from the sixth week of pregnancy. Trophinin and bystin were localized in the cytoplasm of the syncytiotrophoblast in the chorionic villi and in endometrial decidual cells at the uteroplacental interface. After week 10, the levels of trophinin, tastin, and bystin decreased and then disappeared from placental villi.

[73003] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[73004] Fukuda, M. N.; Sato, T.; Nakayama, J.; Klier, G.; Mikami,

M.; Aoki, D.; Nozawa, S. : Trophinin and tastin, a novel cell adhesion molecule complex with potential involvement in embryo implantation. Genes Dev. 9: 1199-1210, 1995. ; and

[73005] Suzuki, N.; Nakayama, J.; Shih, I. M.; Aoki, D.; Nozawa, S.; Fukuda, M. N. : Expression of trophinin, tastin, and bystin by trophoblast and endometrial cells in human placenta. Biol. Reprod.

[73006] Further studies establishing the function and utilities of TRO are found in John Hopkins OMIM database record ID 300132, and in sited publications numbered 10990-10992 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Splicing Factor, Arginine/serine-rich 12 (SFRS12, Accession NM_139168) is another VGAM2097 host target gene. SFRS12 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SFRS12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS12 BINDING SITE, designated SEQ ID:29175, to the nucleotide sequence of VGAM2097 RNA, herein designated VGAM RNA, also designated SEQ

ID:4808.

[73007] Another function of VGAM2097 is therefore inhibition of Splicing Factor, Arginine/serine-rich 12 (SFRS12, Accession NM_139168). Accordingly, utilities of VGAM2097 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS12. Transmembrane 4 Superfamily Member 11 (plasmolipin) (TM4SF11, Accession NM_015993) is another VGAM2097 host target gene. TM4SF11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TM4SF11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TM4SF11 BINDING SITE, designated SEQ ID:18083, to the nucleotide sequence of VGAM2097 RNA, herein designated VGAM RNA, also designated SEQ ID:4808.

[73008] Another function of VGAM2097 is therefore inhibition of Transmembrane 4 Superfamily Member 11 (plasmolipin) (TM4SF11, Accession NM_015993). Accordingly, utilities of VGAM2097 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TM4SF11. Zinc Finger Protein 11b (KOX 2) (ZNF11B, Ac-

cession XM_058399) is another VGAM2097 host target gene. ZNF11B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF11B BINDING SITE, designated SEQ ID:36614, to the nucleotide sequence of VGAM2097 RNA, herein designated VGAM RNA, also designated SEQ ID:4808.

[73009] Another function of VGAM2097 is therefore inhibition of Zinc Finger Protein 11b (KOX 2) (ZNF11B, Accession XM_058399). Accordingly, utilities of VGAM2097 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF11B. LOC158476 (Accession XM_098955) is another VGAM2097 host target gene. LOC158476 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158476 BINDING SITE, designated SEQ ID:41997, to the nucleotide sequence of

VGAM2097 RNA, herein designated VGAM RNA, also designated SEQ ID:4808.

[73010] Another function of VGAM2097 is therefore inhibition of LOC158476 (Accession XM_098955). Accordingly, utilities of VGAM2097 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158476. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2098 (VGAM2098) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73011] VGAM2098 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2098 was detected is described hereinabove with reference to Figs. 1-8.

[73012] VGAM2098 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM2098 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73013] VGAM2098 gene encodes a VGAM2098 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2098 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2098 precursor RNA is designated SEQ ID:2084, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2084 is located at position 174573 relative to the genome of Camelpox Virus.

[73014] VGAM2098 precursor RNA folds onto itself, forming VGAM2098 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73015] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2098 folded precursor RNA into VGAM2098 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2098 RNA is designated SEQ ID:4809, and is provided hereinbelow with reference to the sequence listing part.

[73016] VGAM2098 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2098 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2098 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73017] VGAM2098 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2098 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2098 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2098 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2098 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73018] The complementary binding of VGAM2098 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2098 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2098 host target RNA into VGAM2098 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73019] It is appreciated that VGAM2098 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2098 host target genes. The mRNA of each one of this plurality of VGAM2098 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2098 RNA, herein designated VGAM RNA, and which when bound by VGAM2098 RNA causes inhibition of translation of respective one or more VGAM2098 host target proteins.

[73020] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2098 gene, herein designated VGAM GENE, on one or more VGAM2098 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73021] It is yet further appreciated that a function of VGAM2098 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2098 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM2098 correlate with, and may be deduced from, the identity of the host target genes which VGAM2098 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73022] Nucleotide sequences of the VGAM2098 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2098 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2098 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2098 are further described hereinbelow with reference to Table 1.

[73023] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2098 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2098 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73024] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2098 gene, herein designated VGAM is inhibition of expression of VGAM2098 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2098 correlate with, and may be deduced from, the identity of the target genes which VGAM2098 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73025] ATP-binding Cassette, Sub-family B (MDR/TAP), Member 4 (ABCB4, Accession NM_000443) is a VGAM2098 host target gene. ABCB4 BINDING SITE1 and ABCB4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABCB4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCB4 BINDING SITE1 and ABCB4 BINDING SITE2, designated SEQ ID:6030 and SEQ ID:20835 respectively, to the nucleotide sequence of VGAM2098 RNA, herein designated VGAM RNA, also designated SEQ ID:4809.

[73026] A function of VGAM2098 is therefore inhibition of ATP-binding Cassette, Sub-family B (MDR/TAP), Member 4 (ABCB4, Accession NM_000443). Accordingly, utilities of VGAM2098 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCB4. FLJ20152 (Accession NM_019000) is another VGAM2098 host target gene. FLJ20152 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20152, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20152 BINDING SITE, designated SEQ ID:21071, to the nucleotide sequence of VGAM2098 RNA, herein designated VGAM RNA, also designated SEQ ID:4809.

[73027] Another function of VGAM2098 is therefore inhibition of FLJ20152 (Accession NM_019000). Accordingly, utilities of VGAM2098 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20152. KIAA0923 (Accession NM_014021) is another VGAM2098 host target gene. KIAA0923 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0923, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0923 BINDING SITE, designated SEQ ID:15244, to the nucleotide sequence of VGAM2098 RNA, herein designated VGAM RNA, also designated SEQ ID:4809.

[73028] Another function of VGAM2098 is therefore inhibition of KIAA0923 (Accession NM_014021). Accordingly, utilities of VGAM2098 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0923. LOC144920 (Accession XM_096688) is another VGAM2098 host target gene. LOC144920 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144920 BINDING SITE, designated SEQ ID:40465, to the nucleotide sequence of VGAM2098 RNA, herein designated VGAM RNA, also designated SEQ ID:4809.

[73029] Another function of VGAM2098 is therefore inhibition of LOC144920 (Accession XM_096688). Accordingly, utilities of VGAM2098 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC144920. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2099 (VGAM2099) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73030] VGAM2099 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2099 was detected is described hereinabove with reference to Figs. 1-8.

[73031] VGAM2099 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM2099 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73032] VGAM2099 gene encodes a VGAM2099 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2099 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2099 precursor RNA is desig-

nated SEQ ID:2085, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2085 is located at position 174840 relative to the genome of Camelpox Virus.

[73033] VGAM2099 precursor RNA folds onto itself, forming VGAM2099 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73034] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2099 folded precursor RNA into VGAM2099 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2099 RNA is designated SEQ ID:4810, and is provided hereinbelow with reference to the sequence

listing part.

[73035] VGAM2099 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2099 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2099 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73036] VGAM2099 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2099 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2099 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2099 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2099 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73037] The complementary binding of VGAM2099 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2099 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2099 host target RNA into VGAM2099 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73038] It is appreciated that VGAM2099 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2099 host target genes. The mRNA of each one of this plurality of VGAM2099 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2099 RNA, herein designated VGAM

RNA, and which when bound by VGAM2099 RNA causes inhibition of translation of respective one or more VGAM2099 host target proteins.

[73039] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2099 gene, herein designated VGAM GENE, on one or more VGAM2099 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73040] It is yet further appreciated that a function of VGAM2099 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2099 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM2099 correlate with, and may be deduced from, the identity of the host target genes which VGAM2099 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73041] Nucleotide sequences of the VGAM2099 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2099 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2099 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2099 are further described hereinbelow with reference to Table 1.

[73042] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2099 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2099 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73043] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2099 gene, herein designated VGAM is

inhibition of expression of VGAM2099 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2099 correlate with, and may be deduced from, the identity of the target genes which VGAM2099 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73044] NEBL (Accession NM_006393) is a VGAM2099 host target gene. NEBL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NEBL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEBL BINDING SITE, designated SEQ ID:13095, to the nucleotide sequence of VGAM2099 RNA, herein designated VGAM RNA, also designated SEQ ID:4810.

[73045] A function of VGAM2099 is therefore inhibition of NEBL (Accession NM_006393). Accordingly, utilities of VGAM2099 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEBL. DKFZp761K1423 (Accession NM_018422) is another VGAM2099 host target gene. DKFZp761K1423 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp761K1423,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761K1423 BINDING SITE, designated SEQ ID:20473, to the nucleotide sequence of VGAM2099 RNA, herein designated VGAM RNA, also designated SEQ ID:4810.

[73046] Another function of VGAM2099 is therefore inhibition of DKFZp761K1423 (Accession NM_018422). Accordingly, utilities of VGAM2099 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761K1423. NESHBP (Accession NM_015429) is another VGAM2099 host target gene. NESHBP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NESHBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NESHBP BINDING SITE, designated SEQ ID:17726, to the nucleotide sequence of VGAM2099 RNA, herein designated VGAM RNA, also designated SEQ ID:4810.

[73047] Another function of VGAM2099 is therefore inhibition of NESHBP (Accession NM_015429). Accordingly, utilities of

VGAM2099 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NESHBP. LOC145786 (Accession XM_096860) is another VGAM2099 host target gene. LOC145786 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145786 BINDING SITE, designated SEQ ID:40589, to the nucleotide sequence of VGAM2099 RNA, herein designated VGAM RNA, also designated SEQ ID:4810.

[73048] Another function of VGAM2099 is therefore inhibition of LOC145786 (Accession XM_096860). Accordingly, utilities of VGAM2099 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145786. LOC157292 (Accession XM_098740) is another VGAM2099 host target gene. LOC157292 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC157292 BINDING SITE, designated SEQ ID:41773, to the nucleotide sequence of VGAM2099 RNA, herein designated VGAM RNA, also designated SEQ ID:4810.

[73049] Another function of VGAM2099 is therefore inhibition of LOC157292 (Accession XM_098740). Accordingly, utilities of VGAM2099 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157292. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2100 (VGAM2100) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73050] VGAM2100 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2100 was detected is described hereinabove with reference to Figs. 1-8.

[73051] VGAM2100 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM2100 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73052] VGAM2100 gene encodes a VGAM2100 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2100 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2100 precursor RNA is designated SEQ ID:2086, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2086 is located at position 176689 relative to the genome of Camelpox Virus.

[73053] VGAM2100 precursor RNA folds onto itself, forming VGAM2100 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73054] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2100 folded precursor RNA into VGAM2100 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2100 RNA is designated SEQ ID:4811, and is provided hereinbelow with reference to the sequence listing part.

[73055] VGAM2100 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2100 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2100 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73056] VGAM2100 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2100 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2100 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2100 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2100 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73057] The complementary binding of VGAM2100 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2100 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2100 host target RNA into VGAM2100 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73058] It is appreciated that VGAM2100 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2100 host target genes. The mRNA of each one of this plurality of VGAM2100 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2100 RNA, herein designated VGAM RNA, and which when bound by VGAM2100 RNA causes inhibition of translation of respective one or more VGAM2100 host target proteins.

[73059] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2100 gene, herein designated VGAM GENE, on one or more VGAM2100 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73060] It is yet further appreciated that a function of VGAM2100 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2100 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM2100 correlate with, and may be deduced from, the identity of the host target genes which VGAM2100 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73061] Nucleotide sequences of the VGAM2100 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2100 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2100 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2100 are further described hereinbelow with reference to Table 1.

[73062] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2100 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2100 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73063] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2100 gene, herein designated VGAM is inhibition of expression of VGAM2100 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2100 correlate with, and may be deduced from, the identity of the target genes which VGAM2100 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73064] Rho Guanine Nucleotide Exchange Factor (GEF) 12 (ARHGEF12, Accession NM_015313) is a VGAM2100 host target gene. ARHGEF12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARHGEF12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF12 BINDING SITE, designated SEQ ID:17630, to the nucleotide sequence of VGAM2100 RNA, herein designated VGAM RNA, also designated SEQ ID:4811.

[73065] A function of VGAM2100 is therefore inhibition of Rho Guanine Nucleotide Exchange Factor (GEF) 12 (ARHGEF12, Accession NM_015313). Accordingly, utilities of VGAM2100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF12. Prostaglandin-endoperoxide Synthase 1 (prostaglandin G/H synthase and cyclooxygenase) (PTGS1, Accession NM_080591) is another VGAM2100 host target gene. PTGS1 BINDING SITE1 and PTGS1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTGS1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGS1 BINDING SITE1 and PTGS1 BINDING SITE2, designated SEQ ID:27893 and SEQ ID:6672 respectively, to the nucleotide sequence of VGAM2100 RNA, herein designated VGAM RNA, also designated SEQ ID:4811.

[73066] Another function of VGAM2100 is therefore inhibition of Prostaglandin-endoperoxide Synthase 1 (prostaglandin G/H synthase and cyclooxygenase) (PTGS1, Accession NM_080591), a gene which may play an important role in regulating or promoting cell proliferation in some normal

and neoplastically transformed cells. Accordingly, utilities of VGAM2100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGS1. The function of PTGS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1224.BCMP1 (Accession NM_031442) is another VGAM2100 host target gene. BCMP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCMP1 BINDING SITE, designated SEQ ID:25455, to the nucleotide sequence of VGAM2100 RNA, herein designated VGAM RNA, also designated SEQ ID:4811.

[73067] Another function of VGAM2100 is therefore inhibition of BCMP1 (Accession NM_031442). Accordingly, utilities of VGAM2100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCMP1. Chromosome 20 Open Reading Frame 45 (C20orf45, Accession NM_016045) is another VGAM2100 host target gene. C20orf45 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by C20orf45, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf45 BINDING SITE, designated SEQ ID:18121, to the nucleotide sequence of VGAM2100 RNA, herein designated VGAM RNA, also designated SEQ ID:4811.

[73068] Another function of VGAM2100 is therefore inhibition of Chromosome 20 Open Reading Frame 45 (C20orf45, Accession NM_016045). Accordingly, utilities of VGAM2100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf45. FLJ10726 (Accession NM_018195) is another VGAM2100 host target gene. FLJ10726 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10726, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10726 BINDING SITE, designated SEQ ID:20059, to the nucleotide sequence of VGAM2100 RNA, herein designated VGAM RNA, also designated SEQ ID:4811.

[73069] Another function of VGAM2100 is therefore inhibition of FLJ10726 (Accession NM_018195). Accordingly, utilities of VGAM2100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10726. FLJ20079 (Accession NM_017656) is another VGAM2100 host target gene. FLJ20079 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20079, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20079 BINDING SITE, designated SEQ ID:19171, to the nucleotide sequence of VGAM2100 RNA, herein designated VGAM RNA, also designated SEQ ID:4811.

[73070] Another function of VGAM2100 is therefore inhibition of FLJ20079 (Accession NM_017656). Accordingly, utilities of VGAM2100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20079. FLJ20508 (Accession NM_017850) is another VGAM2100 host target gene. FLJ20508 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20508 BINDING SITE, designated SEQ ID:19516, to the nucleotide sequence of VGAM2100 RNA, herein designated VGAM RNA, also designated SEQ ID:4811.

[73071] Another function of VGAM2100 is therefore inhibition of FLJ20508 (Accession NM_017850). Accordingly, utilities of VGAM2100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20508. FLJ22794 (Accession XM_166220) is another VGAM2100 host target gene. FLJ22794 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22794 BINDING SITE, designated SEQ ID:44039, to the nucleotide sequence of VGAM2100 RNA, herein designated VGAM RNA, also designated SEQ ID:4811.

[73072] Another function of VGAM2100 is therefore inhibition of FLJ22794 (Accession XM_166220). Accordingly, utilities of VGAM2100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ22794. Histamine Receptor H4 (HRH4, Accession NM_021624) is another VGAM2100 host target gene. HRH4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HRH4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRH4 BINDING SITE, designated SEQ ID:22263, to the nucleotide sequence of VGAM2100 RNA, herein designated VGAM RNA, also designated SEQ ID:4811.

[73073] Another function of VGAM2100 is therefore inhibition of Histamine Receptor H4 (HRH4, Accession NM_021624). Accordingly, utilities of VGAM2100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRH4. KIAA0565 (Accession XM_039912) is another VGAM2100 host target gene. KIAA0565 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0565 BINDING SITE, designated SEQ ID:33218, to the nucleotide sequence of VGAM2100 RNA,

herein designated VGAM RNA, also designated SEQ ID:4811.

[73074] Another function of VGAM2100 is therefore inhibition of KIAA0565 (Accession XM_039912). Accordingly, utilities of VGAM2100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0565. Phosphodiesterase 3A, CGMP-inhibited (PDE3A, Accession NM_000921) is another VGAM2100 host target gene. PDE3A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE3A BINDING SITE, designated SEQ ID:6631, to the nucleotide sequence of VGAM2100 RNA, herein designated VGAM RNA, also designated SEQ ID:4811.

[73075] Another function of VGAM2100 is therefore inhibition of Phosphodiesterase 3A, CGMP-inhibited (PDE3A, Accession NM_000921). Accordingly, utilities of VGAM2100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE3A. LOC148254 (Accession XM_086121) is another VGAM2100 host target

gene. LOC148254 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148254, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148254 BINDING SITE, designated SEQ ID:38505, to the nucleotide sequence of VGAM2100 RNA, herein designated VGAM RNA, also designated SEQ ID:4811.

[73076] Another function of VGAM2100 is therefore inhibition of LOC148254 (Accession XM_086121). Accordingly, utilities of VGAM2100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148254. LOC256207 (Accession XM_170837) is another VGAM2100 host target gene. LOC256207 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256207, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256207 BINDING SITE, designated SEQ ID:45619, to the nucleotide sequence of VGAM2100 RNA, herein designated VGAM RNA, also designated SEQ ID:4811.

[73077] Another function of VGAM2100 is therefore inhibition of LOC256207 (Accession XM_170837). Accordingly, utilities of VGAM2100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256207. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2101 (VGAM2101) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73078] VGAM2101 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2101 was detected is described hereinabove with reference to Figs. 1-8.

[73079] VGAM2101 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM2101 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73080] VGAM2101 gene encodes a VGAM2101 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2101 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2101 precursor RNA is designated SEQ ID:2087, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2087 is located at position 171927 relative to the genome of Camelpox Virus.

[73081] VGAM2101 precursor RNA folds onto itself, forming VGAM2101 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73082] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2101 folded precursor RNA into VGAM2101 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2101 RNA is designated SEQ ID:4812, and is provided hereinbelow with reference to the sequence listing part.

[73083] VGAM2101 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2101 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2101 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73084] VGAM2101 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2101 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2101 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2101 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2101 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73085] The complementary binding of VGAM2101 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2101 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2101 host target RNA into VGAM2101 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73086] It is appreciated that VGAM2101 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2101 host target genes. The mRNA of each one of this plurality of VGAM2101 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2101 RNA, herein designated VGAM RNA, and which when bound by VGAM2101 RNA causes inhibition of translation of respective one or more VGAM2101 host target proteins.

[73087] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2101 gene, herein designated VGAM GENE, on one or more VGAM2101 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73088] It is yet further appreciated that a function of VGAM2101 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2101 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM2101 correlate with, and may be deduced from, the identity of the host target genes which VGAM2101 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73089] Nucleotide sequences of the VGAM2101 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2101 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2101 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2101 are further described hereinbelow with reference to Table 1.

[73090] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2101 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2101 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[73091] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2101 gene, herein designated VGAM is inhibition of expression of VGAM2101 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2101 correlate with, and may be deduced from, the identity of the target genes which VGAM2101 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73092] BarH-like 1 (Drosophila) (BARHL1, Accession NM_020064) is a VGAM2101 host target gene. BARHL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BARHL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BARHL1 BINDING SITE, designated SEQ ID:21299, to the nucleotide sequence of VGAM2101 RNA, herein designated VGAM RNA, also designated SEQ ID:4812.

[73093] A function of VGAM2101 is therefore inhibition of BarH-like 1 (Drosophila) (BARHL1, Accession NM_020064), a gene which controls the expression of neural adhesion molecules. Accordingly, utilities of VGAM2101 include di-

agnosis, prevention and treatment of diseases and clinical conditions associated with BARHL1. The function of BARHL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1006.Collagen, Type I, Alpha 1 (COL1A1, Accession NM_000088) is another VGAM2101 host target gene. COL1A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COL1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL1A1 BINDING SITE, designated SEQ ID:5537, to the nucleotide sequence of VGAM2101 RNA, herein designated VGAM RNA, also designated SEQ ID:4812.

[73094] Another function of VGAM2101 is therefore inhibition of Collagen, Type I, Alpha 1 (COL1A1, Accession NM_000088). Accordingly, utilities of VGAM2101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL1A1. SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily A, Member 3 (SMARCA3, Accession

NM_003071) is another VGAM2101 host target gene. SMARCA3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMARCA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCA3 BINDING SITE, designated SEQ ID:9036, to the nucleotide sequence of VGAM2101 RNA, herein designated VGAM RNA, also designated SEQ ID:4812.

[73095] Another function of VGAM2101 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily A, Member 3 (SMARCA3, Accession NM_003071), a gene which is involved in chromatin assembly and remodeling. Accordingly, utilities of VGAM2101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCA3. The function of SMARCA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1330.ABLIM (Accession NM_002313) is another VGAM2101 host target gene. ABLIM BINDING SITE1 and ABLIM BINDING SITE2 are HOST

TARGET binding sites found in untranslated regions of mRNA encoded by ABLIM, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABLIM BINDING SITE1 and ABLIM BINDING SITE2, designated SEQ ID:8109 and SEQ ID:13542 respectively, to the nucleotide sequence of VGAM2101 RNA, herein designated VGAM RNA, also designated SEQ ID:4812.

[73096] Another function of VGAM2101 is therefore inhibition of ABLIM (Accession NM_002313). Accordingly, utilities of VGAM2101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABLIM. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2102 (VGAM2102) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73097] VGAM2102 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2102 was detected is described hereinabove with reference to Figs. 1-8.

[73098] VGAM2102 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM2102 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73099] VGAM2102 gene encodes a VGAM2102 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2102 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2102 precursor RNA is designated SEQ ID:2088, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2088 is located at position 168981 relative to the genome of Camelpox Virus.

[73100] VGAM2102 precursor RNA folds onto itself, forming VGAM2102 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[73101] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2102 folded precursor RNA into VGAM2102 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM2102 RNA is designated SEQ ID:4813, and is provided hereinbelow with reference to the sequence listing part.

[73102] VGAM2102 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2102 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2102 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73103] VGAM2102 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2102 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2102 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2102 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2102 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73104] The complementary binding of VGAM2102 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2102 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2102 host target RNA into VGAM2102 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73105] It is appreciated that VGAM2102 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2102 host target genes. The mRNA of each one of this plurality of VGAM2102 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2102 RNA, herein designated VGAM RNA, and which when bound by VGAM2102 RNA causes inhibition of translation of respective one or more VGAM2102 host target proteins.

[73106] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2102 gene, herein designated VGAM GENE, on one or more VGAM2102 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73107] It is yet further appreciated that a function of VGAM2102 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2102 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM2102 correlate with, and may be deduced from, the identity of the host target genes which VGAM2102 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73108] Nucleotide sequences of the VGAM2102 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2102 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2102 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2102 are further described hereinbelow with reference to Table 1.

[73109] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2102 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2102 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73110] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2102 gene, herein designated VGAM is inhibition of expression of VGAM2102 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2102 correlate with, and may be deduced from, the identity of the target genes which VGAM2102 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73111] Heparan Sulfate 2-O-sulfotransferase 1 (HS2ST1, Accession NM_012262) is a VGAM2102 host target gene. HS2ST1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HS2ST1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of HS2ST1 BINDING SITE, designated SEQ ID:14578, to the nucleotide sequence of VGAM2102 RNA, herein designated VGAM RNA, also designated SEQ ID:4813.

[73112] A function of VGAM2102 is therefore inhibition of Heparan Sulfate 2-O-sulfotransferase 1 (HS2ST1, Accession NM_012262). Accordingly, utilities of VGAM2102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HS2ST1. Pleiomorphic Adenoma Gene-like 1 (PLAGL1, Accession NM_002656) is another VGAM2102 host target gene. PLAGL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLAGL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAGL1 BINDING SITE, designated SEQ ID:8529, to the nucleotide sequence of VGAM2102 RNA, herein designated VGAM RNA, also designated SEQ ID:4813.

[73113] Another function of VGAM2102 is therefore inhibition of Pleiomorphic Adenoma Gene-like 1 (PLAGL1, Accession NM_002656), a gene which regulates apoptosis and cell

cycle arrest. Accordingly, utilities of VGAM2102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAGL1. The function of PLAGL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM89.Protein Phosphatase 1, Catalytic Subunit, Beta Isoform (PPP1CB, Accession NM_002709) is another VGAM2102 host target gene. PPP1CB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP1CB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1CB BINDING SITE, designated SEQ ID:8555, to the nucleotide sequence of VGAM2102 RNA, herein designated VGAM RNA, also designated SEQ ID:4813.

[73114] Another function of VGAM2102 is therefore inhibition of Protein Phosphatase 1, Catalytic Subunit, Beta Isoform (PPP1CB, Accession NM_002709), a gene which is the catalytic subunit of protein phosphatase 1. Accordingly, utilities of VGAM2102 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with PPP1CB. The function of PPP1CB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM46.Protein Tyrosine Phosphatase, Receptor Type, J (PTPRJ, Accession NM_002843) is another VGAM2102 host target gene. PTPRJ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTPRJ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRJ BINDING SITE, designated SEQ ID:8729, to the nucleotide sequence of VGAM2102 RNA, herein designated VGAM RNA, also designated SEQ ID:4813.

[73115] Another function of VGAM2102 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, J (PTPRJ, Accession NM_002843), a gene which Receptor-type protein tyrosine phosphatase J. Accordingly, utilities of VGAM2102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRJ. The function of PTPRJ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM552.Tumor-associated Calcium Signal Transducer 2 (TACSTD2, Accession NM_002353) is another VGAM2102 host target gene. TACSTD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TACSTD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TACSTD2 BINDING SITE, designated SEQ ID:8159, to the nucleotide sequence of VGAM2102 RNA, herein designated VGAM RNA, also designated SEQ ID:4813.

[73116] Another function of VGAM2102 is therefore inhibition of Tumor-associated Calcium Signal Transducer 2 (TACSTD2, Accession NM_002353), a gene which belongs to ga733 tumor-associated antigen gene family and may function as growth factor receptors. Accordingly, utilities of VGAM2102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TACSTD2. The function of TACSTD2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM210.CAT56 (Accession NM_025263) is another VGAM2102 host target gene.

CAT56 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CAT56, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAT56 BINDING SITE, designated SEQ ID:24933, to the nucleotide sequence of VGAM2102 RNA, herein designated VGAM RNA, also designated SEQ ID:4813.

[73117] Another function of VGAM2102 is therefore inhibition of CAT56 (Accession NM_025263). Accordingly, utilities of VGAM2102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAT56. DKFZp761K1423 (Accession NM_018422) is another VGAM2102 host target gene. DKFZp761K1423 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp761K1423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761K1423 BINDING SITE, designated SEQ ID:20474, to the nucleotide sequence of VGAM2102 RNA, herein designated VGAM RNA, also designated SEQ

ID:4813.

[73118] Another function of VGAM2102 is therefore inhibition of DKFZp761K1423 (Accession NM_018422). Accordingly, utilities of VGAM2102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761K1423. KIAA0155 (Accession NM_014633) is another VGAM2102 host target gene. KIAA0155 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0155 BINDING SITE, designated SEQ ID:16004, to the nucleotide sequence of VGAM2102 RNA, herein designated VGAM RNA, also designated SEQ ID:4813.

[73119] Another function of VGAM2102 is therefore inhibition of KIAA0155 (Accession NM_014633). Accordingly, utilities of VGAM2102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0155. KIAA1198 (Accession XM_032674) is another VGAM2102 host target gene. KIAA1198 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1198, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1198 BINDING SITE, designated SEQ ID:31714, to the nucleotide sequence of VGAM2102 RNA, herein designated VGAM RNA, also designated SEQ ID:4813.

[73120] Another function of VGAM2102 is therefore inhibition of KIAA1198 (Accession XM_032674). Accordingly, utilities of VGAM2102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1198. KIAA1915 (Accession XM_055481) is another VGAM2102 host target gene. KIAA1915 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1915, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1915 BINDING SITE, designated SEQ ID:36267, to the nucleotide sequence of VGAM2102 RNA, herein designated VGAM RNA, also designated SEQ ID:4813.

[73121] Another function of VGAM2102 is therefore inhibition of KIAA1915 (Accession XM_055481). Accordingly, utilities of VGAM2102 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1915. Zinc Finger Protein 387 (ZNF387, Accession NM_014682) is another VGAM2102 host target gene. ZNF387 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF387 BINDING SITE, designated SEQ ID:16173, to the nucleotide sequence of VGAM2102 RNA, herein designated VGAM RNA, also designated SEQ ID:4813.

[73122] Another function of VGAM2102 is therefore inhibition of Zinc Finger Protein 387 (ZNF387, Accession NM_014682). Accordingly, utilities of VGAM2102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF387. LOC147343 (Accession XM_097225) is another VGAM2102 host target gene. LOC147343 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147343, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC147343 BINDING SITE, designated SEQ ID:40832, to the nucleotide sequence of VGAM2102 RNA, herein designated VGAM RNA, also designated SEQ ID:4813.

[73123] Another function of VGAM2102 is therefore inhibition of LOC147343 (Accession XM_097225). Accordingly, utilities of VGAM2102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147343. LOC164684 (Accession XM_092926) is another VGAM2102 host target gene. LOC164684 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC164684, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164684 BINDING SITE, designated SEQ ID:40161, to the nucleotide sequence of VGAM2102 RNA, herein designated VGAM RNA, also designated SEQ ID:4813.

[73124] Another function of VGAM2102 is therefore inhibition of LOC164684 (Accession XM_092926). Accordingly, utilities of VGAM2102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164684. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2103 (VGAM2103) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73125] VGAM2103 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2103 was detected is described hereinabove with reference to Figs. 1-8.

[73126] VGAM2103 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM2103 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73127] VGAM2103 gene encodes a VGAM2103 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2103 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2103 precursor RNA is designated SEQ ID:2089, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2089 is located at position 177859 relative to the genome of Camelpox Virus.

[73128] VGAM2103 precursor RNA folds onto itself, forming VGAM2103 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73129] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2103 folded precursor RNA into VGAM2103 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2103 RNA is designated SEQ ID:4814, and is provided hereinbelow with reference to the sequence listing part.

[73130] VGAM2103 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2103 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2103 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73131] VGAM2103 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2103 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2103 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2103 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2103 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73132] The complementary binding of VGAM2103 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2103 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2103 host target RNA into VGAM2103 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73133] It is appreciated that VGAM2103 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2103 host target genes. The mRNA of each one of this plurality of VGAM2103 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2103 RNA, herein designated VGAM RNA, and which when bound by VGAM2103 RNA causes inhibition of translation of respective one or more

VGAM2103 host target proteins.

[73134] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2103 gene, herein designated VGAM GENE, on one or more VGAM2103 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73135] It is yet further appreciated that a function of VGAM2103 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2103 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific

functions, and accordingly utilities, of VGAM2103 correlate with, and may be deduced from, the identity of the host target genes which VGAM2103 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73136] Nucleotide sequences of the VGAM2103 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2103 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2103 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2103 are further described hereinbelow with reference to Table 1.

[73137] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2103 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2103 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73138] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2103 gene, herein designated VGAM is inhibition of expression of VGAM2103 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2103 correlate with, and may be deduced from, the identity of the target genes which VGAM2103 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73139] Protocadherin 10 (PCDH10, Accession NM_032961) is a VGAM2103 host target gene. PCDH10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDH10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH10 BINDING SITE, designated SEQ ID:26771, to the nucleotide sequence of VGAM2103 RNA, herein designated VGAM RNA, also designated SEQ ID:4814.

[73140] A function of VGAM2103 is therefore inhibition of Protocadherin 10 (PCDH10, Accession NM_032961). Accordingly, utilities of VGAM2103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH10. LOC150848 (Accession XM_097959) is another VGAM2103 host target gene. LOC150848 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150848, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150848 BINDING SITE, designated SEQ ID:41257, to the nucleotide sequence of VGAM2103 RNA, herein designated VGAM RNA, also designated SEQ ID:4814.

[73141] Another function of VGAM2103 is therefore inhibition of LOC150848 (Accession XM_097959). Accordingly, utilities of VGAM2103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150848. LOC160414 (Accession XM_100898) is another VGAM2103 host target gene. LOC160414 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC160414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC160414 BINDING SITE, designated SEQ ID:42105, to the nucleotide sequence of VGAM2103 RNA, herein designated VGAM RNA, also designated SEQ ID:4814.

[73142] Another function of VGAM2103 is therefore inhibition of LOC160414 (Accession XM_100898). Accordingly, utilities of VGAM2103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC160414. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2104 (VGAM2104) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73143] VGAM2104 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2104 was detected is described hereinabove with reference to Figs. 1-8.

[73144] VGAM2104 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM2104 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73145] VGAM2104 gene encodes a VGAM2104 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2104 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2104 precursor RNA is designated SEQ ID:2090, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2090 is located at position 161818 relative to the genome of Camelpox Virus.

[73146] VGAM2104 precursor RNA folds onto itself, forming VGAM2104 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73147] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2104 folded precursor RNA into VGAM2104 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2104 RNA is designated SEQ ID:4815, and is provided hereinbelow with reference to the sequence listing part.

[73148] VGAM2104 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2104 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2104 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73149] VGAM2104 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2104 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2104 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2104 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2104 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73150] The complementary binding of VGAM2104 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2104 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2104 host target RNA into VGAM2104 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73151] It is appreciated that VGAM2104 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2104 host target genes. The mRNA of each one of this plurality of VGAM2104 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2104 RNA, herein designated VGAM RNA, and which when bound by VGAM2104 RNA causes

inhibition of translation of respective one or more VGAM2104 host target proteins.

[73152] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2104 gene, herein designated VGAM GENE, on one or more VGAM2104 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73153] It is yet further appreciated that a function of VGAM2104 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2104 include diagnosis, prevention and

treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM2104 correlate with, and may be deduced from, the identity of the host target genes which VGAM2104 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73154] Nucleotide sequences of the VGAM2104 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2104 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2104 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2104 are further described hereinbelow with reference to Table 1.

[73155] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2104 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2104 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73156] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2104 gene, herein designated VGAM is inhibition of expression of VGAM2104 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2104 correlate with, and may be deduced from, the identity of the target genes which VGAM2104 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73157] Catenin, Beta Interacting Protein 1 (CTNNBIP1, Accession NM_020248) is a VGAM2104 host target gene. CTNNBIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CTNNBIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTNNBIP1 BINDING SITE, designated SEQ ID:21542, to the nucleotide sequence of VGAM2104 RNA, herein designated VGAM RNA, also designated SEQ ID:4815.

[73158] A function of VGAM2104 is therefore inhibition of Catenin, Beta Interacting Protein 1 (CTNNBIP1, Accession NM_020248). Accordingly, utilities of VGAM2104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTNNBIP1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred

to here as Viral Genomic Address Messenger 2105 (VGAM2105) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73159] VGAM2105 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2105 was detected is described hereinabove with reference to Figs. 1-8.

[73160] VGAM2105 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Grapevine Chrome Mosaic Virus. VGAM2105 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73161] VGAM2105 gene encodes a VGAM2105 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2105 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2105 precursor RNA is designated SEQ ID:2091, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2091 is located at position 3783 relative to the genome of Grapevine Chrome Mosaic Virus.

[73162] VGAM2105 precursor RNA folds onto itself, forming VGAM2105 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73163] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2105 folded precursor RNA into VGAM2105 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM2105 RNA is designated SEQ ID:4816, and is provided hereinbelow with reference to the sequence listing part.

[73164] VGAM2105 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2105 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2105 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73165] VGAM2105 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2105 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2105 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2105 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2105 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73166] The complementary binding of VGAM2105 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2105 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2105 host target RNA into VGAM2105 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73167] It is appreciated that VGAM2105 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2105 host target genes. The mRNA of each one of this plurality of VGAM2105 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2105 RNA, herein designated VGAM RNA, and which when bound by VGAM2105 RNA causes inhibition of translation of respective one or more VGAM2105 host target proteins.

[73168] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2105 gene, herein designated VGAM GENE, on one or more VGAM2105 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73169] It is yet further appreciated that a function of VGAM2105 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2105 include diagnosis, prevention and treatment of viral infection by Grapevine Chrome Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2105 correlate with, and may be deduced from, the

identity of the host target genes which VGAM2105 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73170] Nucleotide sequences of the VGAM2105 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2105 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2105 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2105 are further described hereinbelow with reference to Table 1.

[73171] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2105 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2105 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73172] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2105 gene, herein designated VGAM is inhibition of expression of VGAM2105 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2105 correlate with, and may be deduced from, the identity of the target genes which VGAM2105

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73173] KIAA0459 (Accession XM_027862) is a VGAM2105 host target gene. KIAA0459 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0459, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0459 BINDING SITE, designated SEQ ID:30571, to the nucleotide sequence of VGAM2105 RNA, herein designated VGAM RNA, also designated SEQ ID:4816.

[73174] A function of VGAM2105 is therefore inhibition of KIAA0459 (Accession XM_027862). Accordingly, utilities of VGAM2105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0459. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2106 (VGAM2106) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73175] VGAM2106 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2106 was detected is described hereinabove with reference to Figs. 1-8.

[73176] VGAM2106 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Grapevine Chrome Mosaic Virus. VGAM2106 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73177] VGAM2106 gene encodes a VGAM2106 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2106 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2106 precursor RNA is designated SEQ ID:2092, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2092 is located at position 4094 relative to the genome of Grapevine Chrome Mosaic Virus.

[73178] VGAM2106 precursor RNA folds onto itself, forming VGAM2106 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73179] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2106 folded precursor RNA into VGAM2106 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM2106 RNA is designated SEQ ID:4817, and is provided hereinbelow with reference to the sequence listing part.

[73180] VGAM2106 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2106 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2106 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[73181] VGAM2106 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2106 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2106 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2106 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2106 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73182] The complementary binding of VGAM2106 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2106 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2106 host target RNA into VGAM2106 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73183] It is appreciated that VGAM2106 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2106 host target genes. The mRNA of each one of this plurality of VGAM2106 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2106 RNA, herein designated VGAM RNA, and which when bound by VGAM2106 RNA causes inhibition of translation of respective one or more VGAM2106 host target proteins.

[73184] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2106 gene, herein designated VGAM GENE, on one or more VGAM2106 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73185] It is yet further appreciated that a function of VGAM2106 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2106 include diagnosis, prevention and treatment of viral infection by Grapevine Chrome Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2106 correlate with, and may be deduced from, the identity of the host target genes which VGAM2106 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73186] Nucleotide sequences of the VGAM2106 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2106 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2106 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2106 are further described hereinbelow with reference to Table 1.

[73187] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2106 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2106 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73188] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2106 gene, herein designated VGAM is inhibition of expression of VGAM2106 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2106 correlate with, and may be deduced from, the identity of the target genes which VGAM2106 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73189] Cystathionine-beta-synthase (CBS, Accession NM_000071) is a VGAM2106 host target gene. CBS BIND-

ING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CBS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBS BINDING SITE, designated SEQ ID:5517, to the nucleotide sequence of VGAM2106 RNA, herein designated VGAM RNA, also designated SEQ ID:4817.

[73190] A function of VGAM2106 is therefore inhibition of Cystathionine-beta-synthase (CBS, Accession NM_000071). Accordingly, utilities of VGAM2106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBS. RAB6A, Member RAS Oncogene Family (RAB6A, Accession NM_002869) is another VGAM2106 host target gene. RAB6A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB6A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB6A BINDING SITE, designated SEQ ID:8776, to the nucleotide sequence of VGAM2106 RNA, herein designated VGAM RNA, also designated SEQ ID:4817.

[73191] Another function of VGAM2106 is therefore inhibition of RAB6A, Member RAS Oncogene Family (RAB6A, Accession NM_002869), a gene which is involved in protein trafficking. Accordingly, utilities of VGAM2106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB6A. The function of RAB6A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217.Sodium Channel, Voltage-gated, Type I, Alpha Polypeptide (SCN1A, Accession XM_114281) is another VGAM2106 host target gene. SCN1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCN1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN1A BINDING SITE, designated SEQ ID:42835, to the nucleotide sequence of VGAM2106 RNA, herein designated VGAM RNA, also designated SEQ ID:4817.

[73192] Another function of VGAM2106 is therefore inhibition of Sodium Channel, Voltage-gated, Type I, Alpha Polypeptide (SCN1A, Accession XM_114281). Accordingly, utilities of

VGAM2106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN1A. SEC14-like 2 (S. cerevisiae) (SEC14L2, Accession NM_012429) is another VGAM2106 host target gene. SEC14L2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEC14L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC14L2 BINDING SITE, designated SEQ ID:14807, to the nucleotide sequence of VGAM2106 RNA, herein designated VGAM RNA, also designated SEQ ID:4817.

[73193] Another function of VGAM2106 is therefore inhibition of SEC14-like 2 (S. cerevisiae) (SEC14L2, Accession NM_012429). Accordingly, utilities of VGAM2106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC14L2. SEP15 (Accession NM_004261) is another VGAM2106 host target gene. SEP15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEP15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of SEP15 BINDING SITE, designated SEQ ID:10454, to the nucleotide sequence of VGAM2106 RNA, herein designated VGAM RNA, also designated SEQ ID:4817.

[73194] Another function of VGAM2106 is therefore inhibition of SEP15 (Accession NM_004261). Accordingly, utilities of VGAM2106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEP15. LOC147514 (Accession XM_041564) is another VGAM2106 host target gene. LOC147514 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147514 BINDING SITE, designated SEQ ID:33547, to the nucleotide sequence of VGAM2106 RNA, herein designated VGAM RNA, also designated SEQ ID:4817.

[73195] Another function of VGAM2106 is therefore inhibition of LOC147514 (Accession XM_041564). Accordingly, utilities of VGAM2106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC147514. LOC90625 (Accession XM_033004) is another VGAM2106 host target gene. LOC90625 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90625, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90625 BINDING SITE, designated SEQ ID:31818, to the nucleotide sequence of VGAM2106 RNA, herein designated VGAM RNA, also designated SEQ ID:4817.

[73196] Another function of VGAM2106 is therefore inhibition of LOC90625 (Accession XM_033004). Accordingly, utilities of VGAM2106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90625. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2107 (VGAM2107) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73197] VGAM2107 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2107 was detected is described hereinabove with reference to Figs. 1-8.

[73198] VGAM2107 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Grapevine Chrome Mosaic Virus. VGAM2107 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73199] VGAM2107 gene encodes a VGAM2107 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2107 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2107 precursor RNA is designated SEQ ID:2093, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2093 is located at position 2929 relative to the genome of Grapevine Chrome Mosaic Virus.

[73200] VGAM2107 precursor RNA folds onto itself, forming VGAM2107 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73201] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2107 folded precursor RNA into VGAM2107 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM2107 RNA is designated SEQ ID:4818, and is provided hereinbelow with reference to the sequence listing part.

[73202] VGAM2107 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2107 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2107 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73203] VGAM2107 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2107 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2107 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2107 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2107 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73204] The complementary binding of VGAM2107 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2107 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2107 host target RNA into VGAM2107 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73205] It is appreciated that VGAM2107 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2107 host target genes. The mRNA of each one of this plurality of VGAM2107 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2107 RNA, herein designated VGAM RNA, and which when bound by VGAM2107 RNA causes inhibition of translation of respective one or more VGAM2107 host target proteins.

[73206] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2107 gene, herein designated VGAM GENE, on one or more VGAM2107 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73207] It is yet further appreciated that a function of VGAM2107 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2107 include diagnosis, prevention and treatment of viral infection by Grapevine Chrome Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2107 correlate with, and may be deduced from, the identity of the host target genes which VGAM2107 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73208] Nucleotide sequences of the VGAM2107 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2107 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM2107 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2107 are further described hereinbelow with reference to Table 1.

[73209] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2107 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2107 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73210] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2107 gene, herein designated VGAM is inhibition of expression of VGAM2107 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2107 correlate with, and may be deduced from, the identity of the target genes which VGAM2107 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73211] ATPase, Class VI, Type 11B (ATP11B, Accession XM_087254) is a VGAM2107 host target gene. ATP11B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP11B, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP11B BINDING SITE, designated SEQ ID:39146, to the nucleotide sequence of VGAM2107 RNA, herein designated VGAM RNA, also designated SEQ ID:4818.

[73212] A function of VGAM2107 is therefore inhibition of ATPase, Class VI, Type 11B (ATP11B, Accession XM_087254), a gene which is phosphorylated in their intermediate state, drives uphill transport of ions across membranes. Accordingly, utilities of VGAM2107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP11B. The function of ATP11B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM665.Zinc Finger Protein 76 (expressed in testis) (ZNF76, Accession NM_003427) is another VGAM2107 host target gene. ZNF76 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF76, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF76 BIND-

ING SITE, designated SEQ ID:9477, to the nucleotide sequence of VGAM2107 RNA, herein designated VGAM RNA, also designated SEQ ID:4818.

[73213] Another function of VGAM2107 is therefore inhibition of Zinc Finger Protein 76 (expressed in testis) (ZNF76, Accession NM_003427). Accordingly, utilities of VGAM2107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF76. Zinc Finger Protein 83 (HPF1) (ZNF83, Accession NM_018300) is another VGAM2107 host target gene. ZNF83 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF83, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF83 BINDING SITE, designated SEQ ID:20292, to the nucleotide sequence of VGAM2107 RNA, herein designated VGAM RNA, also designated SEQ ID:4818.

[73214] Another function of VGAM2107 is therefore inhibition of Zinc Finger Protein 83 (HPF1) (ZNF83, Accession NM_018300). Accordingly, utilities of VGAM2107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF83. FLJ11608

(Accession NM_024557) is another VGAM2107 host target gene. FLJ11608 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11608, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11608 BINDING SITE, designated SEQ ID:23778, to the nucleotide sequence of VGAM2107 RNA, herein designated VGAM RNA, also designated SEQ ID:4818.

[73215] Another function of VGAM2107 is therefore inhibition of FLJ11608 (Accession NM_024557). Accordingly, utilities of VGAM2107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11608. HEMK (Accession NM_016173) is another VGAM2107 host target gene. HEMK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HEMK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEMK BINDING SITE, designated SEQ ID:18270, to the nucleotide sequence of VGAM2107 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4818.

[73216] Another function of VGAM2107 is therefore inhibition of HEMK (Accession NM_016173). Accordingly, utilities of VGAM2107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEMK. KIAA0798 (Accession NM_014650) is another VGAM2107 host target gene. KIAA0798 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0798 BINDING SITE, designated SEQ ID:16069, to the nucleotide sequence of VGAM2107 RNA, herein designated VGAM RNA, also designated SEQ ID:4818.

[73217] Another function of VGAM2107 is therefore inhibition of KIAA0798 (Accession NM_014650). Accordingly, utilities of VGAM2107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0798. KIAA1373 (Accession XM_048195) is another VGAM2107 host target gene. KIAA1373 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1373, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1373 BINDING SITE, designated SEQ ID:35125, to the nucleotide sequence of VGAM2107 RNA, herein designated VGAM RNA, also designated SEQ ID:4818.

[73218] Another function of VGAM2107 is therefore inhibition of KIAA1373 (Accession XM_048195). Accordingly, utilities of VGAM2107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1373. MDS024 (Accession NM_021820) is another VGAM2107 host target gene. MDS024 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MDS024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MDS024 BINDING SITE, designated SEQ ID:22398, to the nucleotide sequence of VGAM2107 RNA, herein designated VGAM RNA, also designated SEQ ID:4818.

[73219] Another function of VGAM2107 is therefore inhibition of MDS024 (Accession NM_021820). Accordingly, utilities of VGAM2107 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MDS024. LOC147976 (Accession XM_085980) is another VGAM2107 host target gene. LOC147976 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147976, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147976 BINDING SITE, designated SEQ ID:38425, to the nucleotide sequence of VGAM2107 RNA, herein designated VGAM RNA, also designated SEQ ID:4818.

[73220] Another function of VGAM2107 is therefore inhibition of LOC147976 (Accession XM_085980). Accordingly, utilities of VGAM2107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147976. LOC254170 (Accession XM_170746) is another VGAM2107 host target gene. LOC254170 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254170 BINDING SITE, designated SEQ ID:45503, to

the nucleotide sequence of VGAM2107 RNA, herein designated VGAM RNA, also designated SEQ ID:4818.

[73221] Another function of VGAM2107 is therefore inhibition of LOC254170 (Accession XM_170746). Accordingly, utilities of VGAM2107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254170. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2108 (VGAM2108) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73222] VGAM2108 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2108 was detected is described hereinabove with reference to Figs. 1-8.

[73223] VGAM2108 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Grapevine Chrome Mosaic Virus. VGAM2108 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73224] VGAM2108 gene encodes a VGAM2108 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2108 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2108 precursor RNA is designated SEQ ID:2094, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2094 is located at position 3193 relative to the genome of Grapevine Chrome Mosaic Virus.

[73225] VGAM2108 precursor RNA folds onto itself, forming VGAM2108 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73226] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2108 folded precursor RNA into VGAM2108 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM2108 RNA is designated SEQ ID:4819, and is provided hereinbelow with reference to the sequence listing part.

[73227] VGAM2108 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2108 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2108 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73228] VGAM2108 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2108 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2108 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2108 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2108 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73229] The complementary binding of VGAM2108 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2108 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2108 host target RNA into VGAM2108 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73230] It is appreciated that VGAM2108 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2108 host target genes. The mRNA of each one of this plurality of VGAM2108 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2108 RNA, herein designated VGAM RNA, and which when bound by VGAM2108 RNA causes inhibition of translation of respective one or more VGAM2108 host target proteins.

[73231] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2108 gene, herein designated VGAM GENE, on one or more VGAM2108 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73232] It is yet further appreciated that a function of VGAM2108 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2108 include diagnosis, prevention and treatment of viral infection by Grapevine Chrome Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2108 correlate with, and may be deduced from, the identity of the host target genes which VGAM2108 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73233] Nucleotide sequences of the VGAM2108 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2108 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2108 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2108 are further described hereinbelow with reference to Table 1.

[73234] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2108 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM2108 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73235] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2108 gene, herein designated VGAM is inhibition of expression of VGAM2108 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2108 correlate with, and may be deduced from, the identity of the target genes which VGAM2108 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73236] X-prolyl Aminopeptidase (aminopeptidase P) 2, Membrane-bound (XPNPEP2, Accession NM_003399) is a VGAM2108 host target gene. XPNPEP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by XPNPEP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XPNPEP2 BINDING SITE, designated SEQ ID:9434, to the nucleotide sequence of VGAM2108 RNA, herein designated VGAM RNA, also designated SEQ ID:4819.

[73237] A function of VGAM2108 is therefore inhibition of X-prolyl

Aminopeptidase (aminopeptidase P) 2, Membrane-bound (XPNPEP2, Accession NM_003399), a gene which is a membrane-associated X-prolyl metallopeptidase . Accordingly, utilities of VGAM2108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XPNPEP2. The function of XPNPEP2 has been established by previous studies. Aminopeptidase P is a widely distributed hydrolase that is specific for N-terminal imido bonds, which are common to several collagen degradation products, neuropeptides, vasoactive peptides, and cytokines. Structurally, the enzyme is a member of the 'pita bread fold' family and occurs in mammalian tissues in both soluble and GPI-anchored membrane-bound forms. By RT-PCR using degenerate oligonucleotides based on the pig aminopeptidase P amino acid sequence, and by 5-prime and 3-prime RACE, Venema et al. (1997) isolated human kidney and lung cDNAs encoding XPNPEP2. The deduced XPNPEP2 protein has 673 amino acids and an estimated molecular mass of 75,490 Da. The authors stated that the human and pig XPNPEP2 amino acid sequences show significant evolutionary divergence, with 83% identity; 5 of 6 potential N-glycosylation sites, and 5 of 6 cysteine residues that are

potentially involved in disulfide bond formation, are conserved. Northern blot analysis detected a 3.5-kb XPNPEP2 transcript in human kidney, lung, heart, placenta, liver, small intestine, and colon, but not in brain, skeletal muscle, pancreas, spleen, thymus, prostate, testis, ovary, or leukocytes. Based on these results and on RT-PCR studies, Venema et al. (1997) suggested that the membrane-bound form and the soluble form, which is found in brain and leukocytes, are the products of 2 different genes or of alternative splicing of a single primary transcript. Women with balanced translocations between the long arm of the X chromosome and an autosome frequently suffer premature ovarian failure (POF; 311360). Two critical regions for POF which extend from Xq13 to Xq22 and from Xq22 to Xq26 have been identified by cytogenetic studies. To gain insight into the mechanism(s) responsible for ovarian failure in women with X/autosome translocations, Prueitt et al. (2000) molecularly characterized the translocation breakpoints of 9 X chromosomes. They mapped the breakpoints using somatic cell hybrids retaining the derivative autosome and densely spaced markers from the X-chromosome physical map. One of the POF-associated breakpoints in a critical region (Xq25) mapped to a se-

quenced PAC clone. The translocation disrupts XPNPEP2. XPNPEP2 mRNA was detected in fibroblasts that carried the translocation, suggesting that this gene at least partially escapes X inactivation. Although the physiologic substrates for the enzyme were not known, Prueitt et al. (2000) suggested that XPNPEP2 is a candidate gene for POF.

[73238] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[73239] Venema, R. C.; Ju, H.; Zou, R.; Venema, V. J.; Ryan, J. W. : Cloning and tissue distribution of human membrane-bound aminopeptidase P. Biochim. Biophys. Acta 1354: 45-48, 1997. ; and

[73240] Prueitt, R. L.; Ross, J. L.; Zinn, A. R. : Physical mapping of nine Xq translocation breakpoints and identification of XPNPEP2 as a premature ovarian failure candidate gene. Cytogenet.

[73241] Further studies establishing the function and utilities of XPNPEP2 are found in John Hopkins OMIM database record ID 300145, and in sited publications numbered 958-960 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.KIAA0429

(Accession NM_014751) is another VGAM2108 host target gene. KIAA0429 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0429 BINDING SITE, designated SEQ ID:16463, to the nucleotide sequence of VGAM2108 RNA, herein designated VGAM RNA, also designated SEQ ID:4819.

[73242] Another function of VGAM2108 is therefore inhibition of KIAA0429 (Accession NM_014751). Accordingly, utilities of VGAM2108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0429. KIAA1553 (Accession XM_166320) is another VGAM2108 host target gene. KIAA1553 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1553, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1553 BINDING SITE, designated SEQ ID:44145, to the nucleotide sequence of VGAM2108 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4819.

[73243] Another function of VGAM2108 is therefore inhibition of KIAA1553 (Accession XM_166320). Accordingly, utilities of VGAM2108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1553. Syndecan 3 (N-syndecan) (SDC3, Accession NM_014654) is another VGAM2108 host target gene. SDC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SDC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC3 BINDING SITE, designated SEQ ID:16085, to the nucleotide sequence of VGAM2108 RNA, herein designated VGAM RNA, also designated SEQ ID:4819.

[73244] Another function of VGAM2108 is therefore inhibition of Syndecan 3 (N-syndecan) (SDC3, Accession NM_014654). Accordingly, utilities of VGAM2108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC3. Zinc Finger Protein 33a (KOX 31) (ZNF33A, Accession XM_166119) is another VGAM2108 host target gene. ZNF33A BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by ZNF33A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF33A BINDING SITE, designated SEQ ID:43898, to the nucleotide sequence of VGAM2108 RNA, herein designated VGAM RNA, also designated SEQ ID:4819.

[73245] Another function of VGAM2108 is therefore inhibition of Zinc Finger Protein 33a (KOX 31) (ZNF33A, Accession XM_166119). Accordingly, utilities of VGAM2108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF33A. LOC149401 (Accession XM_086511) is another VGAM2108 host target gene. LOC149401 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149401 BINDING SITE, designated SEQ ID:38734, to the nucleotide sequence of VGAM2108 RNA, herein designated VGAM RNA, also designated SEQ ID:4819.

[73246] Another function of VGAM2108 is therefore inhibition of

LOC149401 (Accession XM_086511). Accordingly, utilities of VGAM2108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149401. LOC150622 (Accession XM_086960) is another VGAM2108 host target gene. LOC150622 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150622 BINDING SITE, designated SEQ ID:38995, to the nucleotide sequence of VGAM2108 RNA, herein designated VGAM RNA, also designated SEQ ID:4819.

[73247] Another function of VGAM2108 is therefore inhibition of LOC150622 (Accession XM_086960). Accordingly, utilities of VGAM2108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150622. LOC219621 (Accession XM_166148) is another VGAM2108 host target gene. LOC219621 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219621, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC219621 BINDING SITE, designated SEQ ID:43968, to the nucleotide sequence of VGAM2108 RNA, herein designated VGAM RNA, also designated SEQ ID:4819.

[73248] Another function of VGAM2108 is therefore inhibition of LOC219621 (Accession XM_166148). Accordingly, utilities of VGAM2108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219621. LOC221477 (Accession XM_166397) is another VGAM2108 host target gene. LOC221477 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221477 BINDING SITE, designated SEQ ID:44255, to the nucleotide sequence of VGAM2108 RNA, herein designated VGAM RNA, also designated SEQ ID:4819.

[73249] Another function of VGAM2108 is therefore inhibition of LOC221477 (Accession XM_166397). Accordingly, utilities of VGAM2108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221477. LOC255995 (Accession XM_173071) is an-

other VGAM2108 host target gene. LOC255995 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255995, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255995 BINDING SITE, designated SEQ ID:46325, to the nucleotide sequence of VGAM2108 RNA, herein designated VGAM RNA, also designated SEQ ID:4819.

[73250] Another function of VGAM2108 is therefore inhibition of LOC255995 (Accession XM_173071). Accordingly, utilities of VGAM2108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255995. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2109 (VGAM2109) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73251] VGAM2109 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2109 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[73252] VGAM2109 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox Virus. VGAM2109 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73253] VGAM2109 gene encodes a VGAM2109 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2109 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2109 precursor RNA is designated SEQ ID:2095, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2095 is located at position 22662 relative to the genome of Goatpox Virus.

[73254] VGAM2109 precursor RNA folds onto itself, forming VGAM2109 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73255] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2109 folded precursor RNA into VGAM2109 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM2109 RNA is designated SEQ ID:4820, and is provided hereinbelow with reference to the sequence listing part.

[73256] VGAM2109 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2109 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2109 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73257] VGAM2109 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2109 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2109 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2109 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2109 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73258] The complementary binding of VGAM2109 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2109 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2109 host target RNA into VGAM2109 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73259] It is appreciated that VGAM2109 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2109 host target genes. The mRNA of each one of this plurality of VGAM2109 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2109 RNA, herein designated VGAM RNA, and which when bound by VGAM2109 RNA causes inhibition of translation of respective one or more VGAM2109 host target proteins.

[73260] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2109 gene, herein designated VGAM GENE, on one or more VGAM2109 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73261] It is yet further appreciated that a function of VGAM2109 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2109 include diagnosis, prevention and treatment of viral infection by Goatpox Virus. Specific functions, and accordingly utilities, of VGAM2109 correlate with, and may be deduced from, the identity of the host target genes which VGAM2109 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73262] Nucleotide sequences of the VGAM2109 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2109 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2109 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2109 are further described hereinbelow with reference to Table 1.

[73263] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2109 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2109 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73264] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2109 gene, herein designated VGAM is inhibition of expression of VGAM2109 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2109 correlate with, and may be deduced from, the identity of the target genes which VGAM2109 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73265] LOC91408 (Accession XM_038290) is a VGAM2109 host target gene. LOC91408 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91408 BINDING SITE, designated SEQ ID:32790, to the nucleotide sequence of VGAM2109 RNA, herein designated VGAM RNA, also designated SEQ ID:4820.

[73266] A function of VGAM2109 is therefore inhibition of LOC91408 (Accession XM_038290). Accordingly, utilities of VGAM2109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91408. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2110 (VGAM2110) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73267] VGAM2110 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2110 was detected is described hereinabove with reference to Figs. 1-8.

[73268] VGAM2110 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Grapevine Chrome Mosaic Virus. VGAM2110 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73269] VGAM2110 gene encodes a VGAM2110 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2110 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2110 precursor RNA is designated SEQ ID:2096, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2096 is located at position 1090 relative to the genome of Grapevine Chrome Mosaic Virus.

[73270] VGAM2110 precursor RNA folds onto itself, forming VGAM2110 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73271] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2110 folded precursor RNA into VGAM2110

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2110 RNA is designated SEQ ID:4821, and is provided hereinbelow with reference to the sequence listing part.

[73272] VGAM2110 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2110 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2110 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73273] VGAM2110 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2110 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2110 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2110 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2110 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73274] The complementary binding of VGAM2110 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2110 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2110 host target RNA into VGAM2110 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[73275] It is appreciated that VGAM2110 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2110 host target genes. The mRNA of each one of this plurality of VGAM2110 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2110 RNA, herein designated VGAM RNA, and which when bound by VGAM2110 RNA causes inhibition of translation of respective one or more VGAM2110 host target proteins.

[73276] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2110 gene, herein designated VGAM GENE, on one or more VGAM2110 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73277] It is yet further appreciated that a function of VGAM2110 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of viral infection by Grapevine Chrome Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2110 correlate with, and may be deduced from, the identity of the host target genes which VGAM2110 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73278] Nucleotide sequences of the VGAM2110 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2110 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2110 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2110 are further described hereinbelow with reference to Table 1.

[73279] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2110 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2110 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73280] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2110 gene, herein designated VGAM is inhibition of expression of VGAM2110 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2110 correlate with, and may be deduced from, the identity of the target genes which VGAM2110 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73281] Glypican 1 (GPC1, Accession NM_002081) is a VGAM2110 host target gene. GPC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GPC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPC1 BINDING SITE, designated SEQ ID:7869, to the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4821.

[73282] A function of VGAM2110 is therefore inhibition of Glypican 1 (GPC1, Accession NM_002081), a gene which may play a role in growth control and differentation. Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPC1. The function of GPC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125.G Protein-coupled Receptor 44 (GPR44, Accession NM_004778) is another VGAM2110 host target gene. GPR44 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GPR44, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR44 BINDING SITE, designated SEQ ID:11174, to the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, also designated SEQ ID:4821.

[73283] Another function of VGAM2110 is therefore inhibition of G Protein-coupled Receptor 44 (GPR44, Accession NM_004778), a gene which mediates signals to the inte-

rior of the cell via activation of heterotrimeric G proteins . Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR44. The function of GPR44 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1669.Islet Cell Autoantigen 1, 69kDa (ICA1, Accession NM_022308) is another VGAM2110 host target gene. ICA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ICA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICA1 BINDING SITE, designated SEQ ID:22737, to the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, also designated SEQ ID:4821.

[73284] Another function of VGAM2110 is therefore inhibition of Islet Cell Autoantigen 1, 69kDa (ICA1, Accession NM_022308), a gene which Islet cell autoantigen 1. Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICA1. The function of ICA1 and its associ-

ation with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1958.LENG4 (Accession NM_024298) is another VGAM2110 host target gene. LENG4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LENG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LENG4 BINDING SITE, designated SEQ ID:23583, to the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, also designated SEQ ID:4821.

[73285] Another function of VGAM2110 is therefore inhibition of LENG4 (Accession NM_024298), a gene which may be a transmembrane protein. Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LENG4. The function of LENG4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM259.PAIP2 (Accession NM_016480) is another VGAM2110 host target gene. PAIP2 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by PAIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAIP2 BINDING SITE, designated SEQ ID:18579, to the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, also designated SEQ ID:4821.

[73286] Another function of VGAM2110 is therefore inhibition of PAIP2 (Accession NM_016480). Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAIP2. Secreted and Transmembrane 1 (SECTM1, Accession NM_003004) is another VGAM2110 host target gene. SECTM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SECTM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SECTM1 BINDING SITE, designated SEQ ID:8910, to the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, also designated SEQ ID:4821.

[73287] Another function of VGAM2110 is therefore inhibition of Secreted and Transmembrane 1 (SECTM1, Accession NM_003004). Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SECTM1. Solute Carrier Family 30 (zinc transporter), Member 3 (SLC30A3, Accession NM_003459) is another VGAM2110 host target gene. SLC30A3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC30A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC30A3 BINDING SITE, designated SEQ ID:9523, to the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, also designated SEQ ID:4821.

[73288] Another function of VGAM2110 is therefore inhibition of Solute Carrier Family 30 (zinc transporter), Member 3 (SLC30A3, Accession NM_003459). Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC30A3. Solute Carrier Family 7 (cationic amino acid transporter, y+ system), Member 5 (SLC7A5, Accession

NM_003486) is another VGAM2110 host target gene. SLC7A5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC7A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A5 BINDING SITE, designated SEQ ID:9575, to the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, also designated SEQ ID:4821.

[73289] Another function of VGAM2110 is therefore inhibition of Solute Carrier Family 7 (cationic amino acid transporter, y+ system), Member 5 (SLC7A5, Accession NM_003486), a gene which mediates transport of large and small neutral amino acids. Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A5. The function of SLC7A5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430.START Domain Containing 4, Sterol Regulated (STARD4, Accession NM_139164) is another VGAM2110 host target gene. STARD4 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by STARD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STARD4 BINDING SITE, designated SEQ ID:29171, to the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, also designated SEQ ID:4821.

[73290] Another function of VGAM2110 is therefore inhibition of START Domain Containing 4, Sterol Regulated (STARD4, Accession NM_139164). Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STARD4. Choline Kinase (CHK, Accession NM_001277) is another VGAM2110 host target gene. CHK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHK BINDING SITE, designated SEQ ID:6943, to the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, also designated SEQ ID:4821.

[73291] Another function of VGAM2110 is therefore inhibition of Choline Kinase (CHK, Accession NM_001277). Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHK. DKFZP434N1817 (Accession XM_042930) is another VGAM2110 host target gene. DKFZP434N1817 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434N1817, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434N1817 BINDING SITE, designated SEQ ID:33814, to the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, also designated SEQ ID:4821.

[73292] Another function of VGAM2110 is therefore inhibition of DKFZP434N1817 (Accession XM_042930). Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434N1817. H11 (Accession NM_014365) is another VGAM2110 host target gene. H11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by H11, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H11 BINDING SITE, designated SEQ ID:15692, to the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, also designated SEQ ID:4821.

[73293] Another function of VGAM2110 is therefore inhibition of H11 (Accession NM_014365). Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H11. KIAA0329 (Accession NM_014844) is another VGAM2110 host target gene. KIAA0329 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0329, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0329 BINDING SITE, designated SEQ ID:16877, to the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, also designated SEQ ID:4821.

[73294] Another function of VGAM2110 is therefore inhibition of KIAA0329 (Accession NM_014844). Accordingly, utilities of VGAM2110 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0329. KIAA0557 (Accession XM_085507) is another VGAM2110 host target gene. KIAA0557 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0557, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0557 BINDING SITE, designated SEQ ID:38204, to the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, also designated SEQ ID:4821.

[73295] Another function of VGAM2110 is therefore inhibition of KIAA0557 (Accession XM_085507). Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0557. MGC4415 (Accession NM_031484) is another VGAM2110 host target gene. MGC4415 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4415 BINDING SITE, designated SEQ ID:25571, to the nucleotide

sequence of VGAM2110 RNA, herein designated VGAM RNA, also designated SEQ ID:4821.

[73296] Another function of VGAM2110 is therefore inhibition of MGC4415 (Accession NM_031484). Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4415. Syntaphilin (SNPH, Accession NM_014723) is another VGAM2110 host target gene. SNPH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SNPH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNPH BINDING SITE, designated SEQ ID:16291, to the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, also designated SEQ ID:4821.

[73297] Another function of VGAM2110 is therefore inhibition of Syntaphilin (SNPH, Accession NM_014723). Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNPH. LOC150504 (Accession XM_001732) is another VGAM2110 host target gene. LOC150504 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by LOC150504, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150504 BINDING SITE, designated SEQ ID:29849, to the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, also designated SEQ ID:4821.

[73298] Another function of VGAM2110 is therefore inhibition of LOC150504 (Accession XM_001732). Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150504. LOC151443 (Accession XM_087200) is another VGAM2110 host target gene. LOC151443 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151443 BINDING SITE, designated SEQ ID:39114, to the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, also designated SEQ ID:4821.

[73299] Another function of VGAM2110 is therefore inhibition of LOC151443 (Accession XM_087200). Accordingly, utilities

of VGAM2110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151443. LOC158236 (Accession XM_098898) is another VGAM2110 host target gene. LOC158236 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158236, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158236 BINDING SITE, designated SEQ ID:41926, to the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, also designated SEQ ID:4821.

[73300] Another function of VGAM2110 is therefore inhibition of LOC158236 (Accession XM_098898). Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158236. LOC158376 (Accession XM_098934) is another VGAM2110 host target gene. LOC158376 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158376, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC158376 BINDING SITE, designated SEQ ID:41973, to the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, also designated SEQ ID:4821.

[73301] Another function of VGAM2110 is therefore inhibition of LOC158376 (Accession XM_098934). Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158376. LOC158402 (Accession XM_098936) is another VGAM2110 host target gene. LOC158402 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158402, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158402 BINDING SITE, designated SEQ ID:41974, to the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, also designated SEQ ID:4821.

[73302] Another function of VGAM2110 is therefore inhibition of LOC158402 (Accession XM_098936). Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158402. LOC199676 (Accession XM_117107) is another VGAM2110 host target gene. LOC199676 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC199676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199676 BINDING SITE, designated SEQ ID:43224, to the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, also designated SEQ ID:4821.

[73303] Another function of VGAM2110 is therefore inhibition of LOC199676 (Accession XM_117107). Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199676. LOC254065 (Accession XM_173239) is another VGAM2110 host target gene. LOC254065 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254065, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254065 BINDING SITE, designated SEQ ID:46522, to the nucleotide sequence of VGAM2110 RNA, herein designated VGAM RNA, also designated SEQ ID:4821.

[73304] Another function of VGAM2110 is therefore inhibition of

LOC254065 (Accession XM_173239). Accordingly, utilities of VGAM2110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254065. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2111 (VGAM2111) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73305] VGAM2111 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2111 was detected is described hereinabove with reference to Figs. 1-8.

[73306] VGAM2111 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sheeppox Virus. VGAM2111 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73307] VGAM2111 gene encodes a VGAM2111 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2111 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2111 precursor RNA is designated SEQ ID:2097, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2097 is located at position 6922 relative to the genome of Sheeppox Virus.

[73308] VGAM2111 precursor RNA folds onto itself, forming VGAM2111 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73309] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2111 folded precursor RNA into VGAM2111 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM2111 RNA is designated SEQ ID:4822, and is provided hereinbelow with reference to the sequence listing part.

[73310] VGAM2111 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2111 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2111 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73311] VGAM2111 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2111 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2111 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2111 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2111 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73312] The complementary binding of VGAM2111 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2111 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2111 host target RNA into VGAM2111 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73313] It is appreciated that VGAM2111 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2111 host target genes. The mRNA of each one of this plurality of VGAM2111 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2111 RNA, herein designated VGAM RNA, and which when bound by VGAM2111 RNA causes inhibition of translation of respective one or more VGAM2111 host target proteins.

[73314] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2111 gene, herein designated VGAM GENE, on one or more VGAM2111 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73315] It is yet further appreciated that a function of VGAM2111

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of viral infection by Sheeppox Virus. Specific functions, and accordingly utilities, of VGAM2111 correlate with, and may be deduced from, the identity of the host target genes which VGAM2111 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73316] Nucleotide sequences of the VGAM2111 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2111 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2111 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2111 are further described hereinbelow with reference to Table 1.

[73317] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2111 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2111 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73318] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2111 gene, herein designated VGAM is inhibition of expression of VGAM2111 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2111 correlate with, and may be deduced from, the identity of the target genes which VGAM2111 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73319] Androgen Receptor (dihydrotestosterone receptor; testicular feminization; spinal and bulbar muscular atrophy; Kennedy disease) (AR, Accession NM_000044) is a VGAM2111 host target gene. AR BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AR BINDING SITE, designated SEQ ID:5485, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73320] A function of VGAM2111 is therefore inhibition of Androgen Receptor (dihydrotestosterone receptor; testicular feminization; spinal and bulbar muscular atrophy;

Kennedy disease) (AR, Accession NM_000044), a gene which are involved in the regulation of eukaryotic gene expression and affect cellular proliferation and differentiation in target tissues. Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AR. The function of AR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1971.Cyclin D1 (PRAD1: parathyroid adenomatosis 1) (CCND1, Accession NM_053056) is another VGAM2111 host target gene. CCND1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CCND1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCND1 BINDING SITE, designated SEQ ID:27602, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73321] Another function of VGAM2111 is therefore inhibition of Cyclin D1 (PRAD1: parathyroid adenomatosis 1) (CCND1, Accession NM_053056), a gene which is involved in the

control of cell cycle and is required for Schwann cell proliferation to proceed normally during Wallerian degeneration. Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCND1. The function of CCND1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM220.CD83 Antigen (activated B lymphocytes, immunoglobulin superfamily) (CD83, Accession NM_004233) is another VGAM2111 host target gene. CD83 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CD83, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD83 BINDING SITE, designated SEQ ID:10425, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73322] Another function of VGAM2111 is therefore inhibition of CD83 Antigen (activated B lymphocytes, immunoglobulin superfamily) (CD83, Accession NM_004233), a gene which may play a significant role in antigen presentation or the

cellular interactions that follow lymphocyte activation. Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD83. The function of CD83 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1929.Chorea Acanthocytosis (CHAC, Accession NM_033305) is another VGAM2111 host target gene. CHAC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHAC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHAC BINDING SITE, designated SEQ ID:27137, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73323] Another function of VGAM2111 is therefore inhibition of Chorea Acanthocytosis (CHAC, Accession NM_033305), a gene which may regulate the cycling of proteins. Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHAC. The function of CHAC and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM650.Cytochrome P450, Subfamily I (aromatic compound-inducible), Polypeptide 2 (CYP1A2, Accession NM_000761) is another VGAM2111 host target gene. CYP1A2 BINDING SITE1 and CYP1A2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CYP1A2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP1A2 BINDING SITE1 and CYP1A2 BINDING SITE2, designated SEQ ID:6410 and SEQ ID:34253 respectively, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73324] Another function of VGAM2111 is therefore inhibition of Cytochrome P450, Subfamily I (aromatic compound-inducible), Polypeptide 2 (CYP1A2, Accession NM_000761), a gene which intervenes in an NADPH-dependent electron transport pathway. Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP1A2. The function of CYP1A2 and its association with various diseases and

clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Desmocollin 2 (DSC2, Accession NM_004949) is another VGAM2111 host target gene. DSC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DSC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSC2 BINDING SITE, designated SEQ ID:11391, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73325] Another function of VGAM2111 is therefore inhibition of Desmocollin 2 (DSC2, Accession NM_004949), a gene which is a component of intercellular desmosome junctions. Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSC2. The function of DSC2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM909.Dystrobrevin, Beta (DTNB, Accession NM_033147) is another VGAM2111 host target gene.

DTNB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DTNB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DTNB BINDING SITE, designated SEQ ID:27005, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73326] Another function of VGAM2111 is therefore inhibition of Dystrobrevin, Beta (DTNB, Accession NM_033147), a gene which is a part of a dystrophin-associated protein complex . Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DTNB. The function of DTNB has been established by previous studies. Dystrophin, a component of muscle that is defective in Duchenne muscular dystrophy (DMD; 310200), binds to a complex of proteins and glycoproteins, the dystrophin-associated protein complex (DPC), which effectively forms a transmembrane link between the extracellular matrix, and the cytoskeleton of the muscle fiber. The DPC can be divided into 3 subcomplexes: the dystroglycan complex, the sarcoglycan complex, and the cytoplasmic complex. The dystroglycan

complex consists of 2 proteins, alpha- and beta-dystroglycan (DAG1, 128239; DAG2, 600119), that bind to laminin and dystrophin, respectively. The sarcoglycan complex is composed of 4 transmembrane glycoproteins: alpha-, beta-, gamma-, and delta-sarcoglycan, and a 25-kD protein 25DAP. Mutations in all 4 sarcoglycan genes have been found in patients with different forms of limb-girdle muscular dystrophy. The cytoplasmic component of the DPC is composed of the syntrophin family of related proteins and the dystrophin-related protein, dystrobrevin. Peters et al. (1997) described beta-dystrobrevin. They cloned cDNAs from human liver libraries that encode a 627-amino acid polypeptide with a predicted molecular weight of 71 kD. The protein copurified with the dystrobrevin short form, Dp71. The mammalian dystrobrevin genes encode several protein isoforms that are expressed in different tissues, including brain and muscle. Blake et al. (1998) designated the isoform expressed in muscle as alpha-dystrobrevin and used the designation beta-dystrobrevin for the dystrophin-related protein they found to be abundantly expressed in brain and other tissues but not in muscle. Beta-dystrobrevin is encoded by a 2.5-kb alternatively spliced transcript that is

found throughout the brain. In common with dystrophin, beta-dystrobrevin is found in neurons of the cortex and hippocampal formation, but it is not found in the brain microvasculature. In the brain, beta-dystrobrevin coprecipitates with the dystrophin isoforms Dp71 and Dp140. The findings of Blake et al. (1998) indicated that the composition of the dystrophin-associated protein complex in the brain differs from that in muscle. Because beta-dystrobrevin and dystrophin are expressed in similar populations of neurons in the hippocampus and cortex, it is possible that beta-dystrobrevin interacts directly with dystrophin. If this is the case, then beta-dystrobrevin levels may be reduced in DMD patients similar to the reduction in sarcolemmal staining seen with other components of the DPC in dystrophic muscle. The findings may be relevant to the cognitive dysfunction affecting many patients with Duchenne muscular dystrophy.

[73327] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[73328] Blake, D. J.; Nawrotzki, R.; Loh, N. Y.; Gorecki, D. C.; Davies, K. E. : Beta-dystrobrevin, a member of the dystrophin-related protein family. Proc. Nat. Acad. Sci. 95:

241-246, 1998. ; and

[73329] Peters, M. F.; O'Brien, K. F.; Sadoulet-Puccio, H. M.; Kunkel, L. M.; Adams, M. E.; Froehner, S. C. : Beta-dystrobrevin, a new member of the dystrophin family: identification, cloning.

[73330] Further studies establishing the function and utilities of DTNB are found in John Hopkins OMIM database record ID 602415, and in sited publications numbered 284 and 1028 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM_004423) is another VGAM2111 host target gene. DVL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DVL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DVL3 BINDING SITE, designated SEQ ID:10687, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73331] Another function of VGAM2111 is therefore inhibition of Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM_004423), a gene which regulates cell prolifera-

tion. Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DVL3. The function of DVL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57.Exostoses (multiple)-like 2 (EXTL2, Accession NM_001439) is another VGAM2111 host target gene. EXTL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EXTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL2 BINDING SITE, designated SEQ ID:7159, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73332] Another function of VGAM2111 is therefore inhibition of Exostoses (multiple)-like 2 (EXTL2, Accession NM_001439), a gene which is homologous to the EXT and EXTL genes. Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXTL2. The function of EXTL2 and its association with various diseases and clini-

cal conditions, has been established by previous studies, as described hereinabove with reference to VGAM743.Holocarboxylase Synthetase (biotin-[proprionyl-Coenzyme A-carboxylase (ATP-hydrolysing)] Ligase) (HLCS, Accession NM_000411) is another VGAM2111 host target gene. HLCS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HLCS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HLCS BINDING SITE, designated SEQ ID:5986, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73333] Another function of VGAM2111 is therefore inhibition of Holocarboxylase Synthetase (biotin-[proprionyl-Coenzyme A-carboxylase (ATP-hydrolysing)] Ligase) (HLCS, Accession NM_000411). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HLCS. Hairy Homolog (Drosophila) (HRY, Accession NM_005524) is another VGAM2111 host target gene. HRY BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by HRY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRY BINDING SITE, designated SEQ ID:12048, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73334] Another function of VGAM2111 is therefore inhibition of Hairy Homolog (Drosophila) (HRY, Accession NM_005524), a gene which may act as a negative regulator of myogenesis . Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRY. The function of HRY has been established by previous studies. By site-directed mutagenesis and overexpression of HRY in human fibroblasts, Yan et al. (2002) showed that HRY, as well as YY1 (OMIM Ref. No. 600013), functions as a transcriptional activator of acid alpha-glucosidase (GAA; 606800). Using gel shift assays, they found that HRY binds to a 25-bp enhancer element within the first intron of the GAA gene. In previous studies, Yan et al. (2001) had found that HRY, binding to the same element of the GAA gene in hepatoma cells,

acts as a GAA transcription silencer. Yan et al. (2002) noted that the dual function of HRY is likely to contribute to the subtle tissue-specific control of housekeeping genes such as GAA. Votruba et al. (1998) identified no mutations in the HRY gene in 36 patients from 18 pedigrees with OPA1. Using a polymorphism in the untranslated region of exon 2 of HRY, Votruba et al. (1998) found recombination between HRY and OPA1 in 1 pedigree.

[73335] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[73336] Yan, B.; Heus, J.; Lu, N.; Nichols, R. C.; Raben, N.; Plotz, P. H. : Transcriptional regulation of the human acid alpha-glucosidase gene: identification of a repressor element and its transcription factors Hes-1 and YY1. J. Biol. Chem. 276: 1789-1793, 2001. ; and

[73337] Yan, B.; Raben, N.; Plotz, P. H. : Hes-1, a known transcriptional repressor, acts as a transcriptional activator for the human acid alpha-glucosidase gene in human fibroblast cells. Bi.

[73338] Further studies establishing the function and utilities of HRY are found in John Hopkins OMIM database record ID 139605, and in sited publications numbered 3572-3575

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Nuclear Receptor Subfamily 1, Group I, Member 2 (NR1I2, Accession NM_003889) is another VGAM2111 host target gene. NR1I2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NR1I2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR1I2 BINDING SITE, designated SEQ ID:9973, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73339] Another function of VGAM2111 is therefore inhibition of Nuclear Receptor Subfamily 1, Group I, Member 2 (NR1I2, Accession NM_003889), a gene which binds to a response element in the cyp3a4 gene promoter and activates its expression in response to a wide variety of endobiotics and xenobiotics. Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR1I2. The function of NR1I2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM336.Nuclear Receptor Subfamily 4, Group A, Member 2 (NR4A2, Accession NM_006186) is another VGAM2111 host target gene. NR4A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NR4A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR4A2 BINDING SITE, designated SEQ ID:12856, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73340] Another function of VGAM2111 is therefore inhibition of Nuclear Receptor Subfamily 4, Group A, Member 2 (NR4A2, Accession NM_006186), a gene which may be a general coactivator of transcription. Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR4A2. The function of NR4A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM127.P53AIP1 (Accession NM_022112) is another VGAM2111 host target gene. P53AIP1 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by P53AIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P53AIP1 BINDING SITE, designated SEQ ID:22657, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73341] Another function of VGAM2111 is therefore inhibition of P53AIP1 (Accession NM_022112). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P53AIP1. Protein Kinase, CGMP-dependent, Type I (PRKG1, Accession NM_006258) is another VGAM2111 host target gene. PRKG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRKG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKG1 BINDING SITE, designated SEQ ID:12935, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73342] Another function of VGAM2111 is therefore inhibition of

Protein Kinase, CGMP-dependent, Type I (PRKG1, Accession NM_006258), a gene which relaxes vascular smooth muscle and inhibits platelet aggregation. Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKG1. The function of PRKG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1571.Protein Tyrosine Phosphatase, Non-receptor Type 2 (PTPN2, Accession NM_002828) is another VGAM2111 host target gene. PTPN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPN2 BINDING SITE, designated SEQ ID:8704, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73343] Another function of VGAM2111 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type 2 (PTPN2, Accession NM_002828). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with PTPN2. Synaptotagmin IV (SYT4, Accession XM_031162) is another VGAM2111 host target gene. SYT4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SYT4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYT4 BINDING SITE, designated SEQ ID:31291, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73344] Another function of VGAM2111 is therefore inhibition of Synaptotagmin IV (SYT4, Accession XM_031162), a gene which may be involved in ca2+-dependent exocytosis of secretory vesicles or may serve as ca2+ sensors in the process of vesicular trafficking and exocytosis. Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT4. The function of SYT4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.X Kell Blood Group Precursor-related, Y-linked (XKRY, Accession NM_004677) is another

VGAM2111 host target gene. XKRY BINDING SITE1 and XKRY BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by XKRY, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XKRY BINDING SITE1 and XKRY BINDING SITE2, designated SEQ ID:11044 and SEQ ID:30153 respectively, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73345] Another function of VGAM2111 is therefore inhibition of X Kell Blood Group Precursor-related, Y-linked (XKRY, Accession NM_004677). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XKRY. Chromosome 6 Open Reading Frame 37 (C6orf37, Accession XM_041375) is another VGAM2111 host target gene. C6orf37 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C6orf37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf37 BINDING SITE, designated SEQ

ID:33506, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73346] Another function of VGAM2111 is therefore inhibition of Chromosome 6 Open Reading Frame 37 (C6orf37, Accession XM_041375). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf37. C6orf5 (Accession NM_015524) is another VGAM2111 host target gene. C6orf5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C6orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf5 BINDING SITE, designated SEQ ID:17776, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73347] Another function of VGAM2111 is therefore inhibition of C6orf5 (Accession NM_015524). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf5. Calcium/calmodulin-dependent Protein Kinase Kinase 2,

Beta (CAMKK2, Accession NM_006549) is another VGAM2111 host target gene. CAMKK2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CAMKK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMKK2 BINDING SITE, designated SEQ ID:13307, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73348] Another function of VGAM2111 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase Kinase 2, Beta (CAMKK2, Accession NM_006549). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK2. Collagen, Type XXI, Alpha 1 (COL21A1, Accession NM_030820) is another VGAM2111 host target gene. COL21A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COL21A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL21A1 BINDING SITE, designated

SEQ ID:25149, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73349] Another function of VGAM2111 is therefore inhibition of Collagen, Type XXI, Alpha 1 (COL21A1, Accession NM_030820). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL21A1. Cysteine Sulfinic Acid Decarboxylase (CSAD, Accession NM_015989) is another VGAM2111 host target gene. CSAD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CSAD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSAD BINDING SITE, designated SEQ ID:18081, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73350] Another function of VGAM2111 is therefore inhibition of Cysteine Sulfinic Acid Decarboxylase (CSAD, Accession NM_015989). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSAD. DKFZP547L112

(Accession XM_039353) is another VGAM2111 host target gene. DKFZP547L112 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP547L112, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP547L112 BINDING SITE, designated SEQ ID:33057, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73351] Another function of VGAM2111 is therefore inhibition of DKFZP547L112 (Accession XM_039353). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP547L112. FLJ12568 (Accession NM_024993) is another VGAM2111 host target gene. FLJ12568 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12568, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12568 BINDING SITE, designated SEQ ID:24554, to the nucleotide sequence of VGAM2111 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4822.

[73352] Another function of VGAM2111 is therefore inhibition of FLJ12568 (Accession NM_024993). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12568. FLJ13409 (Accession NM_024617) is another VGAM2111 host target gene. FLJ13409 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13409, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13409 BINDING SITE, designated SEQ ID:23879, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73353] Another function of VGAM2111 is therefore inhibition of FLJ13409 (Accession NM_024617). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13409. FLJ13841 (Accession NM_024702) is another VGAM2111 host target gene. FLJ13841 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13841, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13841 BINDING SITE, designated SEQ ID:24015, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73354] Another function of VGAM2111 is therefore inhibition of FLJ13841 (Accession NM_024702). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13841. FLJ20340 (Accession NM_017773) is another VGAM2111 host target gene. FLJ20340 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20340 BINDING SITE, designated SEQ ID:19395, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73355] Another function of VGAM2111 is therefore inhibition of FLJ20340 (Accession NM_017773). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ20340. FLJ23058 (Accession NM_024696) is another VGAM2111 host target gene. FLJ23058 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23058, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23058 BINDING SITE, designated SEQ ID:24005, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73356] Another function of VGAM2111 is therefore inhibition of FLJ23058 (Accession NM_024696). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23058. FLJ23548 (Accession NM_024590) is another VGAM2111 host target gene. FLJ23548 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23548, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23548 BINDING SITE, designated SEQ ID:23826, to the nucleotide

sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73357] Another function of VGAM2111 is therefore inhibition of FLJ23548 (Accession NM_024590). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23548. GTP Binding Protein 5 (putative) (GTPBP5, Accession XM_037206) is another VGAM2111 host target gene. GTPBP5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GTPBP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTPBP5 BINDING SITE, designated SEQ ID:32573, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73358] Another function of VGAM2111 is therefore inhibition of GTP Binding Protein 5 (putative) (GTPBP5, Accession XM_037206). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTPBP5. ICAP-1A (Accession NM_004763) is another VGAM2111 host target

gene. ICAP-1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ICAP-1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICAP-1A BINDING SITE, designated SEQ ID:11156, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73359] Another function of VGAM2111 is therefore inhibition of ICAP-1A (Accession NM_004763). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICAP-1A. KIAA0455 (Accession XM_051785) is another VGAM2111 host target gene. KIAA0455 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0455, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0455 BINDING SITE, designated SEQ ID:35880, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73360] Another function of VGAM2111 is therefore inhibition of KIAA0455 (Accession XM_051785). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0455. KIAA0471 (Accession NM_014857) is another VGAM2111 host target gene. KIAA0471 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0471, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0471 BINDING SITE, designated SEQ ID:16913, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73361] Another function of VGAM2111 is therefore inhibition of KIAA0471 (Accession NM_014857). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0471. KIAA1086 (Accession XM_047610) is another VGAM2111 host target gene. KIAA1086 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1086, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1086 BINDING SITE, designated SEQ ID:35011, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73362] Another function of VGAM2111 is therefore inhibition of KIAA1086 (Accession XM_047610). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1086. KIAA1260 (Accession XM_010461) is another VGAM2111 host target gene. KIAA1260 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1260, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1260 BINDING SITE, designated SEQ ID:30154, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73363] Another function of VGAM2111 is therefore inhibition of KIAA1260 (Accession XM_010461). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1260. KIAA1677 (Accession XM_040383) is another VGAM2111 host target gene. KIAA1677 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1677, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1677 BINDING SITE, designated SEQ ID:33289, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73364] Another function of VGAM2111 is therefore inhibition of KIAA1677 (Accession XM_040383). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1677. KIAA1829 (Accession XM_030378) is another VGAM2111 host target gene. KIAA1829 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1829, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1829 BINDING SITE, designated SEQ ID:31033, to the nucleotide sequence of VGAM2111 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4822.

[73365] Another function of VGAM2111 is therefore inhibition of KIAA1829 (Accession XM_030378). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1829. KIAA1866 (Accession XM_027658) is another VGAM2111 host target gene. KIAA1866 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1866, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1866 BINDING SITE, designated SEQ ID:30556, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73366] Another function of VGAM2111 is therefore inhibition of KIAA1866 (Accession XM_027658). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1866. MBLL39 (Accession NM_144778) is another VGAM2111 host target gene. MBLL39 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MBLL39, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBLL39 BINDING SITE, designated SEQ ID:29574, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73367] Another function of VGAM2111 is therefore inhibition of MBLL39 (Accession NM_144778). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBLL39. MGC29891 (Accession NM_144618) is another VGAM2111 host target gene. MGC29891 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC29891, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC29891 BINDING SITE, designated SEQ ID:29436, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73368] Another function of VGAM2111 is therefore inhibition of MGC29891 (Accession NM_144618). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC29891. MOT8 (Accession NM_018836) is another VGAM2111 host target gene. MOT8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MOT8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOT8 BINDING SITE, designated SEQ ID:20826, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73369] Another function of VGAM2111 is therefore inhibition of MOT8 (Accession NM_018836). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOT8. ODZ2 (Accession XM_047995) is another VGAM2111 host target gene. ODZ2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ODZ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ODZ2 BINDING SITE, designated SEQ ID:35095, to the nucleotide sequence of VGAM2111 RNA,

herein designated VGAM RNA, also designated SEQ ID:4822.

[73370] Another function of VGAM2111 is therefore inhibition of ODZ2 (Accession XM_047995). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ODZ2. Proprotein Convertase Subtilisin/kexin Type 7 (PCSK7, Accession NM_004716) is another VGAM2111 host target gene. PCSK7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCSK7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCSK7 BINDING SITE, designated SEQ ID:11077, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73371] Another function of VGAM2111 is therefore inhibition of Proprotein Convertase Subtilisin/kexin Type 7 (PCSK7, Accession NM_004716). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCSK7. Pleckstrin Homology Domain Containing, Family A (phosphoinositide

binding specific) Member 3 (PLEKHA3, Accession NM_019091) is another VGAM2111 host target gene. PLEKHA3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLEKHA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLEKHA3 BINDING SITE, designated SEQ ID:21166, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73372] Another function of VGAM2111 is therefore inhibition of Pleckstrin Homology Domain Containing, Family A (phosphoinositide binding specific) Member 3 (PLEKHA3, Accession NM_019091). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLEKHA3. PRO0478 (Accession NM_014129) is another VGAM2111 host target gene. PRO0478 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO0478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-ING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of PRO0478 BINDING SITE, designated SEQ ID:15396, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73373] Another function of VGAM2111 is therefore inhibition of PRO0478 (Accession NM_014129). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0478. RAB14, Member RAS Oncogene Family (RAB14, Accession NM_016322) is another VGAM2111 host target gene. RAB14 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB14 BINDING SITE, designated SEQ ID:18445, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73374] Another function of VGAM2111 is therefore inhibition of RAB14, Member RAS Oncogene Family (RAB14, Accession NM_016322). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with RAB14. RICH1 (Accession NM_018054) is another VGAM2111 host target gene. RICH1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RICH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RICH1 BINDING SITE, designated SEQ ID:19814, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73375] Another function of VGAM2111 is therefore inhibition of RICH1 (Accession NM_018054). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RICH1. Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 1 (SLC11A1, Accession XM_002585) is another VGAM2111 host target gene. SLC11A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC11A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of SLC11A1 BINDING SITE, designated SEQ ID:29901, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73376] Another function of VGAM2111 is therefore inhibition of Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 1 (SLC11A1, Accession XM_002585). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC11A1. LOC125434 (Accession XM_058921) is another VGAM2111 host target gene. LOC125434 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC125434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC125434 BINDING SITE, designated SEQ ID:36795, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73377] Another function of VGAM2111 is therefore inhibition of LOC125434 (Accession XM_058921). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC125434. LOC145945 (Accession XM_096908) is another VGAM2111 host target gene. LOC145945 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145945 BINDING SITE, designated SEQ ID:40627, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73378] Another function of VGAM2111 is therefore inhibition of LOC145945 (Accession XM_096908). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145945. LOC146520 (Accession XM_085492) is another VGAM2111 host target gene. LOC146520 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146520 BINDING SITE, designated SEQ ID:38183, to

the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73379] Another function of VGAM2111 is therefore inhibition of LOC146520 (Accession XM_085492). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146520. LOC149127 (Accession XM_097584) is another VGAM2111 host target gene. LOC149127 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149127 BINDING SITE, designated SEQ ID:40951, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73380] Another function of VGAM2111 is therefore inhibition of LOC149127 (Accession XM_097584). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149127. LOC158427 (Accession NM_139246) is another VGAM2111 host target gene. LOC158427 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC158427, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158427 BINDING SITE, designated SEQ ID:29244, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73381] Another function of VGAM2111 is therefore inhibition of LOC158427 (Accession NM_139246). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158427. LOC199858 (Accession XM_114040) is another VGAM2111 host target gene. LOC199858 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC199858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199858 BINDING SITE, designated SEQ ID:42628, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73382] Another function of VGAM2111 is therefore inhibition of LOC199858 (Accession XM_114040). Accordingly, utilities

of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199858. LOC199923 (Accession XM_114057) is another VGAM2111 host target gene. LOC199923 BINDING SITE1 and LOC199923 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC199923, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199923 BINDING SITE1 and LOC199923 BINDING SITE2, designated SEQ ID:42663 and SEQ ID:42664 respectively, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73383] Another function of VGAM2111 is therefore inhibition of LOC199923 (Accession XM_114057). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199923. LOC219672 (Accession XM_166111) is another VGAM2111 host target gene. LOC219672 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219672, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219672 BINDING SITE, designated SEQ ID:43887, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73384] Another function of VGAM2111 is therefore inhibition of LOC219672 (Accession XM_166111). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219672. LOC221814 (Accession XM_168226) is another VGAM2111 host target gene. LOC221814 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221814, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221814 BINDING SITE, designated SEQ ID:45095, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73385] Another function of VGAM2111 is therefore inhibition of LOC221814 (Accession XM_168226). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221814. LOC221943 (Accession XM_168343) is another VGAM2111 host target gene. LOC221943 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221943, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221943 BINDING SITE, designated SEQ ID:45115, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73386] Another function of VGAM2111 is therefore inhibition of LOC221943 (Accession XM_168343). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221943. LOC253639 (Accession XM_171060) is another VGAM2111 host target gene. LOC253639 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253639, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253639 BINDING SITE, designated SEQ ID:45853, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73387] Another function of VGAM2111 is therefore inhibition of LOC253639 (Accession XM_171060). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC253639. LOC254659 (Accession XM_170822) is another VGAM2111 host target gene. LOC254659 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254659, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254659 BINDING SITE, designated SEQ ID:45598, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73388] Another function of VGAM2111 is therefore inhibition of LOC254659 (Accession XM_170822). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254659. LOC51141 (Accession XM_043953) is another VGAM2111 host target gene. LOC51141 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51141, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51141 BINDING SITE, designated SEQ ID:34045, to the nucleotide sequence of VGAM2111 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4822.

[73389] Another function of VGAM2111 is therefore inhibition of LOC51141 (Accession XM_043953). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51141. LOC56920 (Accession NM_020163) is another VGAM2111 host target gene. LOC56920 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC56920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56920 BINDING SITE, designated SEQ ID:21379, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73390] Another function of VGAM2111 is therefore inhibition of LOC56920 (Accession NM_020163). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56920. LOC90155 (Accession XM_029487) is another VGAM2111 host target gene. LOC90155 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90155, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90155 BINDING SITE, designated SEQ ID:30898, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73391] Another function of VGAM2111 is therefore inhibition of LOC90155 (Accession XM_029487). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90155. LOC91496 (Accession XM_038788) is another VGAM2111 host target gene. LOC91496 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91496, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91496 BINDING SITE, designated SEQ ID:32919, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73392] Another function of VGAM2111 is therefore inhibition of LOC91496 (Accession XM_038788). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC91496. LOC92973 (Accession XM_048529) is another VGAM2111 host target gene. LOC92973 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92973, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92973 BINDING SITE, designated SEQ ID:35180, to the nucleotide sequence of VGAM2111 RNA, herein designated VGAM RNA, also designated SEQ ID:4822.

[73393] Another function of VGAM2111 is therefore inhibition of LOC92973 (Accession XM_048529). Accordingly, utilities of VGAM2111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92973. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2112 (VGAM2112) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73394] VGAM2112 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2112 was detected is described hereinabove with reference to Figs. 1-8.

[73395] VGAM2112 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Grapevine Chrome Mosaic Virus. VGAM2112 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73396] VGAM2112 gene encodes a VGAM2112 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2112 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2112 precursor RNA is designated SEQ ID:2098, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2098 is located at position 1230 relative to the genome of Grapevine Chrome Mosaic Virus.

[73397] VGAM2112 precursor RNA folds onto itself, forming VGAM2112 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73398] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2112 folded precursor RNA into VGAM2112 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM2112 RNA is designated SEQ ID:4823, and is provided hereinbelow with reference to the sequence listing part.

[73399] VGAM2112 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2112 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2112 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73400] VGAM2112 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2112 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2112 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2112 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2112 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73401] The complementary binding of VGAM2112 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2112 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2112 host target RNA into VGAM2112 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73402] It is appreciated that VGAM2112 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2112 host target genes. The mRNA of each one of this plurality of VGAM2112 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2112 RNA, herein designated VGAM RNA, and which when bound by VGAM2112 RNA causes inhibition of translation of respective one or more VGAM2112 host target proteins.

[73403] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2112 gene, herein designated VGAM GENE, on one or more VGAM2112 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73404] It is yet further appreciated that a function of VGAM2112 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2112 include diagnosis, prevention and treatment of viral infection by Grapevine Chrome Mosaic Virus. Specific functions, and accordingly utilities, of VGAM2112 correlate with, and may be deduced from, the identity of the host target genes which VGAM2112 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73405] Nucleotide sequences of the VGAM2112 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2112 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2112 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2112 are further described hereinbelow with reference to Table 1.

[73406] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2112 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2112 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73407] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2112 gene, herein designated VGAM is inhibition of expression of VGAM2112 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2112 correlate with, and may be deduced from, the identity of the target genes which VGAM2112 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73408] Estrogen Receptor 1 (ESR1, Accession NM_000125) is a VGAM2112 host target gene. ESR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by ESR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESR1 BINDING SITE, designated SEQ ID:5600, to the nucleotide sequence of VGAM2112 RNA, herein designated VGAM RNA, also designated SEQ ID:4823.

[73409] A function of VGAM2112 is therefore inhibition of Estrogen Receptor 1 (ESR1, Accession NM_000125), a gene which involved in hormone-mediated inhibition of gene expression. Accordingly, utilities of VGAM2112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESR1. The function of ESR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM695.Polycystic Kidney Disease 2-like 1 (PKD2L1, Accession NM_016112) is another VGAM2112 host target gene. PKD2L1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PKD2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

PKD2L1 BINDING SITE, designated SEQ ID:18194, to the nucleotide sequence of VGAM2112 RNA, herein designated VGAM RNA, also designated SEQ ID:4823.

[73410] Another function of VGAM2112 is therefore inhibition of Polycystic Kidney Disease 2-like 1 (PKD2L1, Accession NM_016112). Accordingly, utilities of VGAM2112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKD2L1. CGG Triplet Repeat Binding Protein 1 (CGGBP1, Accession NM_003663) is another VGAM2112 host target gene. CGGBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CGGBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGGBP1 BINDING SITE, designated SEQ ID:9739, to the nucleotide sequence of VGAM2112 RNA, herein designated VGAM RNA, also designated SEQ ID:4823.

[73411] Another function of VGAM2112 is therefore inhibition of CGG Triplet Repeat Binding Protein 1 (CGGBP1, Accession NM_003663). Accordingly, utilities of VGAM2112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGGBP1. VRP (Accession

NM_007063) is another VGAM2112 host target gene. VRP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by VRP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VRP BINDING SITE, designated SEQ ID:13927, to the nucleotide sequence of VGAM2112 RNA, herein designated VGAM RNA, also designated SEQ ID:4823.

[73412] Another function of VGAM2112 is therefore inhibition of VRP (Accession NM_007063). Accordingly, utilities of VGAM2112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VRP. LOC155382 (Accession XM_098713) is another VGAM2112 host target gene. LOC155382 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC155382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155382 BINDING SITE, designated SEQ ID:41763, to the nucleotide sequence of VGAM2112 RNA, herein designated VGAM RNA, also designated SEQ ID:4823.

[73413] Another function of VGAM2112 is therefore inhibition of LOC155382 (Accession XM_098713). Accordingly, utilities of VGAM2112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155382. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2113 (VGAM2113) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73414] VGAM2113 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2113 was detected is described hereinabove with reference to Figs. 1-8.

[73415] VGAM2113 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sheeppox Virus. VGAM2113 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73416] VGAM2113 gene encodes a VGAM2113 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM2113 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2113 precursor RNA is designated SEQ ID:2099, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2099 is located at position 7750 relative to the genome of Sheeppox Virus.

[73417] VGAM2113 precursor RNA folds onto itself, forming VGAM2113 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73418] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2113 folded precursor RNA into VGAM2113 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2113 RNA is designated SEQ ID:4824, and is provided hereinbelow with reference to the sequence listing part.

[73419] VGAM2113 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2113 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2113 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73420] VGAM2113 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2113 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2113 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2113 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2113 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73421] The complementary binding of VGAM2113 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2113 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2113 host target RNA into VGAM2113 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73422] It is appreciated that VGAM2113 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2113 host target genes. The mRNA of each one of this plurality of VGAM2113 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2113 RNA, herein designated VGAM RNA, and which when bound by VGAM2113 RNA causes inhibition of translation of respective one or more VGAM2113 host target proteins.

[73423] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2113 gene, herein designated VGAM GENE, on one or more VGAM2113 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73424] It is yet further appreciated that a function of VGAM2113 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2113 include diagnosis, prevention and treatment of viral infection by Sheeppox Virus. Specific functions, and accordingly utilities, of VGAM2113 correlate with, and may be deduced from, the identity of the host target genes which VGAM2113 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73425] Nucleotide sequences of the VGAM2113 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2113 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2113 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2113 are further described hereinbelow with reference to Table 1.

[73426] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2113 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2113 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[73427] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2113 gene, herein designated VGAM is inhibition of expression of VGAM2113 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2113 correlate with, and may be deduced from, the identity of the target genes which VGAM2113 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73428] ATP-binding Cassette, Sub-family D (ALD), Member 4 (ABCD4, Accession NM_020325) is a VGAM2113 host target gene. ABCD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABCD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCD4 BINDING SITE, designated SEQ ID:21586, to the nucleotide sequence of VGAM2113 RNA, herein designated VGAM RNA, also designated SEQ ID:4824.

[73429] A function of VGAM2113 is therefore inhibition of ATP-binding Cassette, Sub-family D (ALD), Member 4 (ABCD4, Accession NM_020325), a gene which Putative peroxiso-

mal ATP binding cassette transporter. Accordingly, utilities of VGAM2113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCD4. The function of ABCD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1924.Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM_012199) is another VGAM2113 host target gene. EIF2C1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EIF2C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF2C1 BINDING SITE, designated SEQ ID:14503, to the nucleotide sequence of VGAM2113 RNA, herein designated VGAM RNA, also designated SEQ ID:4824.

[73430] Another function of VGAM2113 is therefore inhibition of Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM_012199), a gene which plays an important role in the eukaryotic peptide chain initiation process. Accordingly, utilities of VGAM2113 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with EIF2C1. The function of EIF2C1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM118.Oculocerebrorenal Syndrome of Lowe (OCRL, Accession NM_001587) is another VGAM2113 host target gene. OCRL BINDING SITE1 and OCRL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OCRL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OCRL BINDING SITE1 and OCRL BINDING SITE2, designated SEQ ID:7308 and SEQ ID:5821 respectively, to the nucleotide sequence of VGAM2113 RNA, herein designated VGAM RNA, also designated SEQ ID:4824.

[73431] Another function of VGAM2113 is therefore inhibition of Oculocerebrorenal Syndrome of Lowe (OCRL, Accession NM_001587). Accordingly, utilities of VGAM2113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OCRL. SRY (sex determining region Y)-box 9 (campomelic dysplasia, autosomal sex-reversal) (SOX9, Accession NM_000346) is another VGAM2113 host target gene. SOX9 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by SOX9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX9 BINDING SITE, designated SEQ ID:5902, to the nucleotide sequence of VGAM2113 RNA, herein designated VGAM RNA, also designated SEQ ID:4824.

[73432] Another function of VGAM2113 is therefore inhibition of SRY (sex determining region Y)-box 9 (campomelic dysplasia, autosomal sex-reversal) (SOX9, Accession NM_000346), a gene which regulates the expression of other genes involved in chondrogenesis. Accordingly, utilities of VGAM2113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX9. The function of SOX9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM329.FLJ20211 (Accession NM_017713) is another VGAM2113 host target gene. FLJ20211 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20211, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20211 BINDING SITE, designated SEQ ID:19295, to the nucleotide sequence of VGAM2113 RNA, herein designated VGAM RNA, also designated SEQ ID:4824.

[73433] Another function of VGAM2113 is therefore inhibition of FLJ20211 (Accession NM_017713). Accordingly, utilities of VGAM2113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20211. FLJ20574 (Accession NM_017886) is another VGAM2113 host target gene. FLJ20574 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20574, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20574 BINDING SITE, designated SEQ ID:19554, to the nucleotide sequence of VGAM2113 RNA, herein designated VGAM RNA, also designated SEQ ID:4824.

[73434] Another function of VGAM2113 is therefore inhibition of FLJ20574 (Accession NM_017886). Accordingly, utilities of VGAM2113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ20574. JM11 (Accession NM_033626) is another VGAM2113 host target gene. JM11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by JM11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JM11 BINDING SITE, designated SEQ ID:27332, to the nucleotide sequence of VGAM2113 RNA, herein designated VGAM RNA, also designated SEQ ID:4824.

[73435] Another function of VGAM2113 is therefore inhibition of JM11 (Accession NM_033626). Accordingly, utilities of VGAM2113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JM11. KIAA0247 (Accession NM_014734) is another VGAM2113 host target gene. KIAA0247 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0247, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0247 BINDING SITE, designated SEQ ID:16380, to the nucleotide sequence of VGAM2113 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4824.

[73436] Another function of VGAM2113 is therefore inhibition of KIAA0247 (Accession NM_014734). Accordingly, utilities of VGAM2113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0247. KIAA1024 (Accession XM_044580) is another VGAM2113 host target gene. KIAA1024 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1024 BINDING SITE, designated SEQ ID:34237, to the nucleotide sequence of VGAM2113 RNA, herein designated VGAM RNA, also designated SEQ ID:4824.

[73437] Another function of VGAM2113 is therefore inhibition of KIAA1024 (Accession XM_044580). Accordingly, utilities of VGAM2113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1024. KIAA1819 (Accession XM_045716) is another VGAM2113 host target gene. KIAA1819 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1819, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1819 BINDING SITE, designated SEQ ID:34534, to the nucleotide sequence of VGAM2113 RNA, herein designated VGAM RNA, also designated SEQ ID:4824.

[73438] Another function of VGAM2113 is therefore inhibition of KIAA1819 (Accession XM_045716). Accordingly, utilities of VGAM2113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1819. MEGF10 (Accession NM_032446) is another VGAM2113 host target gene. MEGF10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MEGF10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEGF10 BINDING SITE, designated SEQ ID:26211, to the nucleotide sequence of VGAM2113 RNA, herein designated VGAM RNA, also designated SEQ ID:4824.

[73439] Another function of VGAM2113 is therefore inhibition of MEGF10 (Accession NM_032446). Accordingly, utilities of VGAM2113 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MEGF10. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2114 (VGAM2114) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73440] VGAM2114 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2114 was detected is described hereinabove with reference to Figs. 1-8.

[73441] VGAM2114 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM2114 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73442] VGAM2114 gene encodes a VGAM2114 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2114 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2114 precursor RNA is desig-

nated SEQ ID:2100, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2100 is located at position 9163 relative to the genome of Cowpox Virus.

[73443] VGAM2114 precursor RNA folds onto itself, forming VGAM2114 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73444] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2114 folded precursor RNA into VGAM2114 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM2114 RNA is designated SEQ ID:4825, and is provided hereinbelow with reference to the sequence

listing part.

[73445] VGAM2114 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2114 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2114 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73446] VGAM2114 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2114 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2114 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2114 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2114 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73447] The complementary binding of VGAM2114 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2114 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2114 host target RNA into VGAM2114 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73448] It is appreciated that VGAM2114 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2114 host target genes. The mRNA of each one of this plurality of VGAM2114 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2114 RNA, herein designated VGAM

RNA, and which when bound by VGAM2114 RNA causes inhibition of translation of respective one or more VGAM2114 host target proteins.

[73449] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2114 gene, herein designated VGAM GENE, on one or more VGAM2114 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73450] It is yet further appreciated that a function of VGAM2114 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2114 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM2114 correlate with, and may be deduced from, the identity of the host target genes which VGAM2114 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73451] Nucleotide sequences of the VGAM2114 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2114 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2114 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2114 are further described hereinbelow with reference to Table 1.

[73452] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2114 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2114 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73453] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2114 gene, herein designated VGAM is

inhibition of expression of VGAM2114 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2114 correlate with, and may be deduced from, the identity of the target genes which VGAM2114 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73454] Mitogen-activated Protein Kinase 9 (MAPK9, Accession NM_002752) is a VGAM2114 host target gene. MAPK9 BINDING SITE1 through MAPK9 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAPK9, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK9 BINDING SITE1 through MAPK9 BINDING SITE4, designated SEQ ID:8631, SEQ ID:29136, SEQ ID:29138 and SEQ ID:29140 respectively, to the nucleotide sequence of VGAM2114 RNA, herein designated VGAM RNA, also designated SEQ ID:4825.

[73455] A function of VGAM2114 is therefore inhibition of Mitogen-activated Protein Kinase 9 (MAPK9, Accession NM_002752), a gene which Member of the MAP kinase family, regulates c-Jun in response to proinflammatory

cytokines and UV irradiation. Accordingly, utilities of VGAM2114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK9. The function of MAPK9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1958.Parkinson Disease (autosomal recessive, juvenile) 2, Parkin (PARK2, Accession NM_013987) is another VGAM2114 host target gene. PARK2 BINDING SITE1 through PARK2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PARK2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PARK2 BINDING SITE1 through PARK2 BINDING SITE3, designated SEQ ID:15153, SEQ ID:15160 and SEQ ID:8543 respectively, to the nucleotide sequence of VGAM2114 RNA, herein designated VGAM RNA, also designated SEQ ID:4825.

[73456] Another function of VGAM2114 is therefore inhibition of Parkinson Disease (autosomal recessive, juvenile) 2, Parkin (PARK2, Accession NM_013987). Accordingly, utilities of VGAM2114 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with PARK2. RAD52 Homolog (S. cerevisiae) (RAD52, Accession NM_134422) is another VGAM2114 host target gene. RAD52 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAD52, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD52 BINDING SITE, designated SEQ ID:28643, to the nucleotide sequence of VGAM2114 RNA, herein designated VGAM RNA, also designated SEQ ID:4825.

[73457] Another function of VGAM2114 is therefore inhibition of RAD52 Homolog (S. cerevisiae) (RAD52, Accession NM_134422). Accordingly, utilities of VGAM2114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD52. Supervillin (SVIL, Accession NM_021738) is another VGAM2114 host target gene. SVIL BINDING SITE1 and SVIL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SVIL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementar-

ity of the nucleotide sequences of SVIL BINDING SITE1 and SVIL BINDING SITE2, designated SEQ ID:22345 and SEQ ID:9148 respectively, to the nucleotide sequence of VGAM2114 RNA, herein designated VGAM RNA, also designated SEQ ID:4825.

[73458] Another function of VGAM2114 is therefore inhibition of Supervillin (SVIL, Accession NM_021738), a gene which binds actin, links filamentous actin with the plasma membrane; and contains putative nuclear localization signals. Accordingly, utilities of VGAM2114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SVIL. The function of SVIL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1459.C16orf5 (Accession NM_013399) is another VGAM2114 host target gene. C16orf5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C16orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C16orf5 BINDING SITE, designated SEQ ID:15051, to the nucleotide sequence of VGAM2114 RNA,

herein designated VGAM RNA, also designated SEQ ID:4825.

[73459] Another function of VGAM2114 is therefore inhibition of C16orf5 (Accession NM_013399). Accordingly, utilities of VGAM2114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C16orf5. DKFZp547M236 (Accession NM_018713) is another VGAM2114 host target gene. DKFZp547M236 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp547M236, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547M236 BINDING SITE, designated SEQ ID:20791, to the nucleotide sequence of VGAM2114 RNA, herein designated VGAM RNA, also designated SEQ ID:4825.

[73460] Another function of VGAM2114 is therefore inhibition of DKFZp547M236 (Accession NM_018713). Accordingly, utilities of VGAM2114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547M236. E74-like Factor 4 (ets domain transcription factor) (ELF4, Accession NM_001421) is another

VGAM2114 host target gene. ELF4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ELF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELF4 BINDING SITE, designated SEQ ID:7124, to the nucleotide sequence of VGAM2114 RNA, herein designated VGAM RNA, also designated SEQ ID:4825.

[73461] Another function of VGAM2114 is therefore inhibition of E74-like Factor 4 (ets domain transcription factor) (ELF4, Accession NM_001421). Accordingly, utilities of VGAM2114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELF4. Neuronal PAS Domain Protein 3 (NPAS3, Accession NM_022123) is another VGAM2114 host target gene. NPAS3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NPAS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPAS3 BINDING SITE, designated SEQ ID:22667, to the nucleotide sequence of VGAM2114 RNA,

herein designated VGAM RNA, also designated SEQ ID:4825.

[73462] Another function of VGAM2114 is therefore inhibition of Neuronal PAS Domain Protein 3 (NPAS3, Accession NM_022123). Accordingly, utilities of VGAM2114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPAS3. Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 2 (SLC11A2, Accession NM_000617) is another VGAM2114 host target gene. SLC11A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC11A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC11A2 BINDING SITE, designated SEQ ID:6226, to the nucleotide sequence of VGAM2114 RNA, herein designated VGAM RNA, also designated SEQ ID:4825.

[73463] Another function of VGAM2114 is therefore inhibition of Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 2 (SLC11A2, Accession NM_000617). Accordingly, utilities of VGAM2114 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with SLC11A2. Triple Homeobox 1 (TIX1, Accession XM_029734) is another VGAM2114 host target gene. TIX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TIX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIX1 BINDING SITE, designated SEQ ID:30927, to the nucleotide sequence of VGAM2114 RNA, herein designated VGAM RNA, also designated SEQ ID:4825.

[73464] Another function of VGAM2114 is therefore inhibition of Triple Homeobox 1 (TIX1, Accession XM_029734). Accordingly, utilities of VGAM2114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIX1. LOC143173 (Accession XM_016685) is another VGAM2114 host target gene. LOC143173 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC143173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143173 BINDING SITE, designated SEQ

ID:30271, to the nucleotide sequence of VGAM2114 RNA, herein designated VGAM RNA, also designated SEQ ID:4825.

[73465] Another function of VGAM2114 is therefore inhibition of LOC143173 (Accession XM_016685). Accordingly, utilities of VGAM2114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143173. LOC143915 (Accession XM_096502) is another VGAM2114 host target gene. LOC143915 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143915, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143915 BINDING SITE, designated SEQ ID:40379, to the nucleotide sequence of VGAM2114 RNA, herein designated VGAM RNA, also designated SEQ ID:4825.

[73466] Another function of VGAM2114 is therefore inhibition of LOC143915 (Accession XM_096502). Accordingly, utilities of VGAM2114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143915. LOC149302 (Accession XM_086489) is another VGAM2114 host target gene. LOC149302 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149302, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149302 BINDING SITE, designated SEQ ID:38702, to the nucleotide sequence of VGAM2114 RNA, herein designated VGAM RNA, also designated SEQ ID:4825.

[73467] Another function of VGAM2114 is therefore inhibition of LOC149302 (Accession XM_086489). Accordingly, utilities of VGAM2114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149302. LOC170082 (Accession XM_093092) is another VGAM2114 host target gene. LOC170082 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC170082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170082 BINDING SITE, designated SEQ ID:40170, to the nucleotide sequence of VGAM2114 RNA, herein designated VGAM RNA, also designated SEQ ID:4825.

[73468] Another function of VGAM2114 is therefore inhibition of

LOC170082 (Accession XM_093092). Accordingly, utilities of VGAM2114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170082. LOC221477 (Accession XM_166397) is another VGAM2114 host target gene. LOC221477 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221477 BINDING SITE, designated SEQ ID:44257, to the nucleotide sequence of VGAM2114 RNA, herein designated VGAM RNA, also designated SEQ ID:4825.

[73469] Another function of VGAM2114 is therefore inhibition of LOC221477 (Accession XM_166397). Accordingly, utilities of VGAM2114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221477. LOC221760 (Accession XM_168105) is another VGAM2114 host target gene. LOC221760 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221760, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC221760 BINDING SITE, designated SEQ ID:45031, to the nucleotide sequence of VGAM2114 RNA, herein designated VGAM RNA, also designated SEQ ID:4825.

[73470] Another function of VGAM2114 is therefore inhibition of LOC221760 (Accession XM_168105). Accordingly, utilities of VGAM2114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221760. LOC245806 (Accession XM_166309) is another VGAM2114 host target gene. LOC245806 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC245806, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245806 BINDING SITE, designated SEQ ID:44131, to the nucleotide sequence of VGAM2114 RNA, herein designated VGAM RNA, also designated SEQ ID:4825.

[73471] Another function of VGAM2114 is therefore inhibition of LOC245806 (Accession XM_166309). Accordingly, utilities of VGAM2114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC245806. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2115 (VGAM2115) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73472] VGAM2115 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2115 was detected is described hereinabove with reference to Figs. 1-8.

[73473] VGAM2115 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM2115 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73474] VGAM2115 gene encodes a VGAM2115 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2115 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2115 precursor RNA is designated SEQ ID:2101, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2101 is located at position 211598 relative to the genome of Cowpox Virus.

[73475] VGAM2115 precursor RNA folds onto itself, forming VGAM2115 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73476] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2115 folded precursor RNA into VGAM2115 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2115 RNA is designated SEQ ID:4826, and is provided hereinbelow with reference to the sequence listing part.

[73477] VGAM2115 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2115 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2115 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73478] VGAM2115 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2115 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2115 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2115 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2115 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73479] The complementary binding of VGAM2115 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2115 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2115 host target RNA into VGAM2115 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73480] It is appreciated that VGAM2115 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2115 host target genes. The mRNA of each one of this plurality of VGAM2115 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2115 RNA, herein designated VGAM RNA, and which when bound by VGAM2115 RNA causes inhibition of translation of respective one or more

VGAM2115 host target proteins.

[73481] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2115 gene, herein designated VGAM GENE, on one or more VGAM2115 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73482] It is yet further appreciated that a function of VGAM2115 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2115 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific

functions, and accordingly utilities, of VGAM2115 correlate with, and may be deduced from, the identity of the host target genes which VGAM2115 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73483] Nucleotide sequences of the VGAM2115 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2115 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2115 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2115 are further described hereinbelow with reference to Table 1.

[73484] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2115 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2115 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73485] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2115 gene, herein designated VGAM is inhibition of expression of VGAM2115 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2115 correlate with, and may be deduced from, the identity of the target genes which VGAM2115 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73486] Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Zeta Polypeptide (YWHAZ, Accession NM_003406) is a VGAM2115 host target gene. YWHAZ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by YWHAZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YWHAZ BINDING SITE, designated SEQ ID:9445, to the nucleotide sequence of VGAM2115 RNA, herein designated VGAM RNA, also designated SEQ ID:4826.

[73487] A function of VGAM2115 is therefore inhibition of Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Zeta Polypeptide (YWHAZ, Accession NM_003406), a gene which mediates signal transduction by binding to phosphorylated serine residues on a variety of signaling molecules. Accordingly, utilities of VGAM2115 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with YWHAZ. The function of YWHAZ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM43.Parvin, Alpha (PARVA, Accession NM_018222) is another VGAM2115 host target gene. PARVA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PARVA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PARVA BINDING SITE, designated SEQ ID:20145, to the nucleotide sequence of VGAM2115 RNA, herein designated VGAM RNA, also designated SEQ ID:4826.

[73488] Another function of VGAM2115 is therefore inhibition of Parvin, Alpha (PARVA, Accession NM_018222). Accordingly, utilities of VGAM2115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PARVA. LOC254251 (Accession XM_171088) is another VGAM2115 host target gene. LOC254251 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254251, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254251 BINDING SITE, designated SEQ ID:45894, to the nucleotide sequence of VGAM2115 RNA, herein designated VGAM RNA, also designated SEQ ID:4826.

[73489] Another function of VGAM2115 is therefore inhibition of LOC254251 (Accession XM_171088). Accordingly, utilities of VGAM2115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254251. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2116 (VGAM2116) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73490] VGAM2116 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2116 was detected is described hereinabove with reference to Figs. 1-8.

[73491] VGAM2116 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus.

VGAM2116 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[73492] VGAM2116 gene encodes a VGAM2116 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2116 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2116 precursor RNA is designated SEQ ID:2102, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2102 is located at position 208834 relative to the genome of Cowpox Virus.

[73493] VGAM2116 precursor RNA folds onto itself, forming VGAM2116 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73494] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2116 folded precursor RNA into VGAM2116

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM2116 RNA is designated SEQ ID:4827, and is provided hereinbelow with reference to the sequence listing part.

[73495] VGAM2116 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2116 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2116 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73496] VGAM2116 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2116 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2116 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2116 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2116 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73497] The complementary binding of VGAM2116 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2116 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2116 host target RNA into VGAM2116 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[73498] It is appreciated that VGAM2116 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2116 host target genes. The mRNA of each one of this plurality of VGAM2116 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2116 RNA, herein designated VGAM RNA, and which when bound by VGAM2116 RNA causes inhibition of translation of respective one or more VGAM2116 host target proteins.

[73499] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2116 gene, herein designated VGAM GENE, on one or more VGAM2116 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73500] It is yet further appreciated that a function of VGAM2116 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2116 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM2116 correlate with, and may be deduced from, the identity of the host target genes which VGAM2116 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73501] Nucleotide sequences of the VGAM2116 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2116 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2116 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2116 are further described hereinbelow with reference to Table 1.

[73502] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2116 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2116 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73503] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2116 gene, herein designated VGAM is inhibition of expression of VGAM2116 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2116 correlate with, and may be deduced from, the identity of the target genes which VGAM2116 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73504] Aspartate Beta-hydroxylase (ASPH, Accession NM_032466) is a VGAM2116 host target gene. ASPH BINDING SITE1 and ASPH BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ASPH, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASPH BINDING SITE1 and ASPH BINDING SITE2, designated SEQ ID:26222 and SEQ

ID:26227 respectively, to the nucleotide sequence of VGAM2116 RNA, herein designated VGAM RNA, also designated SEQ ID:4827.

[73505] A function of VGAM2116 is therefore inhibition of Aspartate Beta-hydroxylase (ASPH, Accession NM_032466), a gene which specifically hydroxylates the beta carbon of aspartic acid or asparagine residues in certain epidermal growth factor (EGF)-like domains of a number of proteins. Accordingly, utilities of VGAM2116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASPH. The function of ASPH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM47.Tensin (TNS, Accession NM_022648) is another VGAM2116 host target gene. TNS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNS BINDING SITE, designated SEQ ID:22903, to the nucleotide sequence of VGAM2116 RNA, herein designated VGAM RNA, also designated SEQ ID:4827.

[73506] Another function of VGAM2116 is therefore inhibition of Tensin (TNS, Accession NM_022648). Accordingly, utilities of VGAM2116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNS. FLJ10656 (Accession NM_018170) is another VGAM2116 host target gene. FLJ10656 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10656 BINDING SITE, designated SEQ ID:19988, to the nucleotide sequence of VGAM2116 RNA, herein designated VGAM RNA, also designated SEQ ID:4827.

[73507] Another function of VGAM2116 is therefore inhibition of FLJ10656 (Accession NM_018170). Accordingly, utilities of VGAM2116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10656. GABA(A) Receptor-associated Protein Like 1 (GABARAPL1, Accession NM_031412) is another VGAM2116 host target gene. GABARAPL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GABARAPL1, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABARAPL1 BINDING SITE, designated SEQ ID:25392, to the nucleotide sequence of VGAM2116 RNA, herein designated VGAM RNA, also designated SEQ ID:4827.

[73508] Another function of VGAM2116 is therefore inhibition of GABA(A) Receptor-associated Protein Like 1 (GABARAPL1, Accession NM_031412). Accordingly, utilities of VGAM2116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABARAPL1. GABA(A) Receptors Associated Protein Like 3 (GABARAPL3, Accession NM_032568) is another VGAM2116 host target gene. GABARAPL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GABARAPL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABARAPL3 BINDING SITE, designated SEQ ID:26300, to the nucleotide sequence of VGAM2116 RNA, herein designated VGAM RNA, also designated SEQ ID:4827.

[73509] Another function of VGAM2116 is therefore inhibition of

GABA(A) Receptors Associated Protein Like 3 (GABARAPL3, Accession NM_032568). Accordingly, utilities of VGAM2116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABARAPL3. HT002 (Accession NM_014066) is another VGAM2116 host target gene. HT002 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HT002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HT002 BINDING SITE, designated SEQ ID:15281, to the nucleotide sequence of VGAM2116 RNA, herein designated VGAM RNA, also designated SEQ ID:4827.

[73510] Another function of VGAM2116 is therefore inhibition of HT002 (Accession NM_014066). Accordingly, utilities of VGAM2116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HT002. KIAA0194 (Accession XM_038362) is another VGAM2116 host target gene. KIAA0194 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0194, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0194 BINDING SITE, designated SEQ ID:32825, to the nucleotide sequence of VGAM2116 RNA, herein designated VGAM RNA, also designated SEQ ID:4827.

[73511] Another function of VGAM2116 is therefore inhibition of KIAA0194 (Accession XM_038362). Accordingly, utilities of VGAM2116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0194. KIAA0435 (Accession NM_014801) is another VGAM2116 host target gene. KIAA0435 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0435 BINDING SITE, designated SEQ ID:16721, to the nucleotide sequence of VGAM2116 RNA, herein designated VGAM RNA, also designated SEQ ID:4827.

[73512] Another function of VGAM2116 is therefore inhibition of KIAA0435 (Accession NM_014801). Accordingly, utilities of VGAM2116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0435. KIAA0475 (Accession NM_014864) is another VGAM2116 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:16949, to the nucleotide sequence of VGAM2116 RNA, herein designated VGAM RNA, also designated SEQ ID:4827.

[73513] Another function of VGAM2116 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM2116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. KIAA0542 (Accession XM_038520) is another VGAM2116 host target gene. KIAA0542 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0542, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0542 BINDING SITE, designated SEQ ID:32856, to the nucleotide sequence of VGAM2116 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4827.

[73514] Another function of VGAM2116 is therefore inhibition of KIAA0542 (Accession XM_038520). Accordingly, utilities of VGAM2116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0542. KIAA1301 (Accession XM_038999) is another VGAM2116 host target gene. KIAA1301 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1301 BINDING SITE, designated SEQ ID:32974, to the nucleotide sequence of VGAM2116 RNA, herein designated VGAM RNA, also designated SEQ ID:4827.

[73515] Another function of VGAM2116 is therefore inhibition of KIAA1301 (Accession XM_038999). Accordingly, utilities of VGAM2116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1301. KIAA1323 (Accession XM_032146) is another VGAM2116 host target gene. KIAA1323 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1323, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1323 BINDING SITE, designated SEQ ID:31563, to the nucleotide sequence of VGAM2116 RNA, herein designated VGAM RNA, also designated SEQ ID:4827.

[73516] Another function of VGAM2116 is therefore inhibition of KIAA1323 (Accession XM_032146). Accordingly, utilities of VGAM2116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1323. Seizure Related 6 Homolog (mouse) (SEZ6, Accession XM_058869) is another VGAM2116 host target gene. SEZ6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEZ6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEZ6 BINDING SITE, designated SEQ ID:36774, to the nucleotide sequence of VGAM2116 RNA, herein designated VGAM RNA, also designated SEQ ID:4827.

[73517] Another function of VGAM2116 is therefore inhibition of Seizure Related 6 Homolog (mouse) (SEZ6, Accession XM_058869). Accordingly, utilities of VGAM2116 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with SEZ6. LOC132235 (Accession XM_072302) is another VGAM2116 host target gene. LOC132235 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC132235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132235 BINDING SITE, designated SEQ ID:37483, to the nucleotide sequence of VGAM2116 RNA, herein designated VGAM RNA, also designated SEQ ID:4827.

[73518] Another function of VGAM2116 is therefore inhibition of LOC132235 (Accession XM_072302). Accordingly, utilities of VGAM2116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132235. LOC146895 (Accession XM_097120) is another VGAM2116 host target gene. LOC146895 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC146895 BINDING SITE, designated SEQ ID:40761, to the nucleotide sequence of VGAM2116 RNA, herein designated VGAM RNA, also designated SEQ ID:4827.

[73519] Another function of VGAM2116 is therefore inhibition of LOC146895 (Accession XM_097120). Accordingly, utilities of VGAM2116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146895. LOC152024 (Accession XM_087365) is another VGAM2116 host target gene. LOC152024 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152024 BINDING SITE, designated SEQ ID:39198, to the nucleotide sequence of VGAM2116 RNA, herein designated VGAM RNA, also designated SEQ ID:4827.

[73520] Another function of VGAM2116 is therefore inhibition of LOC152024 (Accession XM_087365). Accordingly, utilities of VGAM2116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152024. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 2117 (VGAM2117) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73521] VGAM2117 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2117 was detected is described hereinabove with reference to Figs. 1-8.

[73522] VGAM2117 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM2117 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73523] VGAM2117 gene encodes a VGAM2117 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2117 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2117 precursor RNA is designated SEQ ID:2103, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2103 is located at position 206477 relative to the

genome of Cowpox Virus.

[73524] VGAM2117 precursor RNA folds onto itself, forming VGAM2117 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73525] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2117 folded precursor RNA into VGAM2117 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2117 RNA is designated SEQ ID:4828, and is provided hereinbelow with reference to the sequence listing part.

[73526] VGAM2117 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2117 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2117 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73527] VGAM2117 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2117 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2117 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2117 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2117 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73528] The complementary binding of VGAM2117 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2117 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2117 host target RNA into VGAM2117 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73529] It is appreciated that VGAM2117 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2117 host target genes. The mRNA of each one of this plurality of VGAM2117 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2117 RNA, herein designated VGAM RNA, and which when bound by VGAM2117 RNA causes inhibition of translation of respective one or more VGAM2117 host target proteins.

[73530] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2117 gene, herein designated VGAM GENE, on one or more VGAM2117 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73531] It is yet further appreciated that a function of VGAM2117 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2117 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM2117 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2117 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73532] Nucleotide sequences of the VGAM2117 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2117 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2117 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2117 are further described hereinbelow with reference to Table 1.

[73533] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2117 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2117 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73534] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2117 gene, herein designated VGAM is inhibition of expression of VGAM2117 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2117 correlate with, and may be deduced

from, the identity of the target genes which VGAM2117 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73535] Coagulation Factor VIII, Procoagulant Component (hemophilia A) (F8, Accession NM_000132) is a VGAM2117 host target gene. F8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by F8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F8 BINDING SITE, designated SEQ ID:5613, to the nucleotide sequence of VGAM2117 RNA, herein designated VGAM RNA, also designated SEQ ID:4828.

[73536] A function of VGAM2117 is therefore inhibition of Coagulation Factor VIII, Procoagulant Component (hemophilia A) (F8, Accession NM_000132). Accordingly, utilities of VGAM2117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F8. Microtubule-associated Protein, RP/EB Family, Member 1 (MAPRE1, Accession NM_012325) is another VGAM2117 host target gene. MAPRE1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by MAPRE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPRE1 BINDING SITE, designated SEQ ID:14706, to the nucleotide sequence of VGAM2117 RNA, herein designated VGAM RNA, also designated SEQ ID:4828.

[73537] Another function of VGAM2117 is therefore inhibition of Microtubule-associated Protein, RP/EB Family, Member 1 (MAPRE1, Accession NM_012325). Accordingly, utilities of VGAM2117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPRE1. E2F Transcription Factor 5, P130-binding (E2F5, Accession NM_001951) is another VGAM2117 host target gene. E2F5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by E2F5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of E2F5 BINDING SITE, designated SEQ ID:7673, to the nucleotide sequence of VGAM2117 RNA, herein designated VGAM RNA, also designated SEQ ID:4828.

[73538] Another function of VGAM2117 is therefore inhibition of

E2F Transcription Factor 5, P130-binding (E2F5, Accession NM_001951). Accordingly, utilities of VGAM2117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with E2F5. E74-like Factor 2 (ets domain transcription factor) (ELF2, Accession NM_006874) is another VGAM2117 host target gene. ELF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ELF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELF2 BINDING SITE, designated SEQ ID:13743, to the nucleotide sequence of VGAM2117 RNA, herein designated VGAM RNA, also designated SEQ ID:4828.

[73539] Another function of VGAM2117 is therefore inhibition of E74-like Factor 2 (ets domain transcription factor) (ELF2, Accession NM_006874). Accordingly, utilities of VGAM2117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELF2. KIAA0252 (Accession XM_031646) is another VGAM2117 host target gene. KIAA0252 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0252, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0252 BINDING SITE, designated SEQ ID:31451, to the nucleotide sequence of VGAM2117 RNA, herein designated VGAM RNA, also designated SEQ ID:4828.

[73540] Another function of VGAM2117 is therefore inhibition of KIAA0252 (Accession XM_031646). Accordingly, utilities of VGAM2117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0252. KIAA1855 (Accession XM_166453) is another VGAM2117 host target gene. KIAA1855 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1855 BINDING SITE, designated SEQ ID:44359, to the nucleotide sequence of VGAM2117 RNA, herein designated VGAM RNA, also designated SEQ ID:4828.

[73541] Another function of VGAM2117 is therefore inhibition of KIAA1855 (Accession XM_166453). Accordingly, utilities of VGAM2117 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1855. LOC152578 (Accession XM_098241) is another VGAM2117 host target gene. LOC152578 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152578, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152578 BINDING SITE, designated SEQ ID:41526, to the nucleotide sequence of VGAM2117 RNA, herein designated VGAM RNA, also designated SEQ ID:4828.

[73542] Another function of VGAM2117 is therefore inhibition of LOC152578 (Accession XM_098241). Accordingly, utilities of VGAM2117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152578. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2118 (VGAM2118) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73543] VGAM2118 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2118 was detected is described hereinabove with reference to Figs. 1-8.

[73544] VGAM2118 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM2118 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73545] VGAM2118 gene encodes a VGAM2118 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2118 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2118 precursor RNA is designated SEQ ID:2104, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2104 is located at position 6717 relative to the genome of Cowpox Virus.

[73546] VGAM2118 precursor RNA folds onto itself, forming VGAM2118 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73547] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2118 folded precursor RNA into VGAM2118 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM2118 RNA is designated SEQ ID:4829, and is provided hereinbelow with reference to the sequence listing part.

[73548] VGAM2118 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2118 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2118 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73549] VGAM2118 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2118 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2118 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2118 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2118 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73550] The complementary binding of VGAM2118 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2118 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2118 host target RNA into VGAM2118 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73551] It is appreciated that VGAM2118 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2118 host target genes. The mRNA of each one of this plurality of VGAM2118 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2118 RNA, herein designated VGAM RNA, and which when bound by VGAM2118 RNA causes inhibition of translation of respective one or more VGAM2118 host target proteins.

[73552] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2118 gene, herein designated VGAM GENE, on one or more VGAM2118 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73553] It is yet further appreciated that a function of VGAM2118 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2118 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM2118 correlate with, and may be deduced from, the identity of the host target genes which VGAM2118 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73554] Nucleotide sequences of the VGAM2118 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2118 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2118 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2118 are further described hereinbelow with reference to Table 1.

[73555] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2118 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2118 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73556] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2118 gene, herein designated VGAM is inhibition of expression of VGAM2118 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2118 correlate with, and may be deduced from, the identity of the target genes which VGAM2118 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73557] Kruppel-like Factor 8 (KLF8, Accession NM_007250) is a VGAM2118 host target gene. KLF8 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region

of mRNA encoded by KLF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLF8 BINDING SITE, designated SEQ ID:14122, to the nucleotide sequence of VGAM2118 RNA, herein designated VGAM RNA, also designated SEQ ID:4829.

[73558] A function of VGAM2118 is therefore inhibition of Kruppel-like Factor 8 (KLF8, Accession NM_007250). Accordingly, utilities of VGAM2118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLF8. Tripartite Motif-containing 9 (TRIM9, Accession NM_052978) is another VGAM2118 host target gene. TRIM9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM9 BINDING SITE, designated SEQ ID:27548, to the nucleotide sequence of VGAM2118 RNA, herein designated VGAM RNA, also designated SEQ ID:4829.

[73559] Another function of VGAM2118 is therefore inhibition of

Tripartite Motif-containing 9 (TRIM9, Accession NM_052978), a gene which may function as a positive regulator for mannosylphosphate transferase and is required to mediate mannosylphosphate transfer in both the core and outer chain portions of n-linked. oligosaccharides. Accordingly, utilities of VGAM2118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM9. The function of TRIM9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Transient Receptor Potential Cation Channel, Subfamily C, Member 1 (TRPC1, Accession NM_003304) is another VGAM2118 host target gene. TRPC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRPC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPC1 BINDING SITE, designated SEQ ID:9304, to the nucleotide sequence of VGAM2118 RNA, herein designated VGAM RNA, also designated SEQ ID:4829.

[73560] Another function of VGAM2118 is therefore inhibition of

Transient Receptor Potential Cation Channel, Subfamily C, Member 1 (TRPC1, Accession NM_003304), a gene which acts as a non-voltage-sensitive store-operated Ca2+ channel. Accordingly, utilities of VGAM2118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPC1. The function of TRPC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.Butyrophilin, Subfamily 3, Member A1 (BTN3A1, Accession NM_007048) is another VGAM2118 host target gene. BTN3A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BTN3A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTN3A1 BINDING SITE, designated SEQ ID:13920, to the nucleotide sequence of VGAM2118 RNA, herein designated VGAM RNA, also designated SEQ ID:4829.

[73561] Another function of VGAM2118 is therefore inhibition of Butyrophilin, Subfamily 3, Member A1 (BTN3A1, Accession NM_007048). Accordingly, utilities of VGAM2118 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN3A1. DKFZp761J139 (Accession NM_032280) is another VGAM2118 host target gene. DKFZp761J139 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp761J139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761J139 BINDING SITE, designated SEQ ID:26034, to the nucleotide sequence of VGAM2118 RNA, herein designated VGAM RNA, also designated SEQ ID:4829.

[73562] Another function of VGAM2118 is therefore inhibition of DKFZp761J139 (Accession NM_032280). Accordingly, utilities of VGAM2118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761J139. FLJ20147 (Accession NM_017687) is another VGAM2118 host target gene. FLJ20147 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20147, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FLJ20147 BINDING SITE, designated SEQ ID:19241, to the nucleotide sequence of VGAM2118 RNA, herein designated VGAM RNA, also designated SEQ ID:4829.

[73563] Another function of VGAM2118 is therefore inhibition of FLJ20147 (Accession NM_017687). Accordingly, utilities of VGAM2118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20147. MGC12466 (Accession XM_086336) is another VGAM2118 host target gene. MGC12466 BINDING SITE1 and MGC12466 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MGC12466, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12466 BINDING SITE1 and MGC12466 BINDING SITE2, designated SEQ ID:38608 and SEQ ID:27066 respectively, to the nucleotide sequence of VGAM2118 RNA, herein designated VGAM RNA, also designated SEQ ID:4829.

[73564] Another function of VGAM2118 is therefore inhibition of MGC12466 (Accession XM_086336). Accordingly, utilities of VGAM2118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC12466. LOC202934 (Accession XM_117486) is another VGAM2118 host target gene. LOC202934 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC202934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202934 BINDING SITE, designated SEQ ID:43453, to the nucleotide sequence of VGAM2118 RNA, herein designated VGAM RNA, also designated SEQ ID:4829.

[73565] Another function of VGAM2118 is therefore inhibition of LOC202934 (Accession XM_117486). Accordingly, utilities of VGAM2118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202934. LOC255465 (Accession XM_173206) is another VGAM2118 host target gene. LOC255465 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255465 BINDING SITE, designated SEQ ID:46447, to the nucleotide sequence of VGAM2118 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4829.

[73566] Another function of VGAM2118 is therefore inhibition of LOC255465 (Accession XM_173206). Accordingly, utilities of VGAM2118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255465. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2119 (VGAM2119) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73567] VGAM2119 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2119 was detected is described hereinabove with reference to Figs. 1-8.

[73568] VGAM2119 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM2119 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73569] VGAM2119 gene encodes a VGAM2119 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2119 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2119 precursor RNA is designated SEQ ID:2105, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2105 is located at position 206331 relative to the genome of Cowpox Virus.

[73570] VGAM2119 precursor RNA folds onto itself, forming VGAM2119 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73571] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2119 folded precursor RNA into VGAM2119 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2119 RNA is designated SEQ ID:4830, and is provided hereinbelow with reference to the sequence listing part.

[73572] VGAM2119 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2119 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2119 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73573] VGAM2119 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2119 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2119 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2119 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2119 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73574] The complementary binding of VGAM2119 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2119 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2119 host target RNA into VGAM2119 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73575] It is appreciated that VGAM2119 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2119 host target genes. The mRNA of

each one of this plurality of VGAM2119 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2119 RNA, herein designated VGAM RNA, and which when bound by VGAM2119 RNA causes inhibition of translation of respective one or more VGAM2119 host target proteins.

[73576] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2119 gene, herein designated VGAM GENE, on one or more VGAM2119 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[73577] It is yet further appreciated that a function of VGAM2119 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2119 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM2119 correlate with, and may be deduced from, the identity of the host target genes which VGAM2119 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73578] Nucleotide sequences of the VGAM2119 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2119 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2119 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2119 are further described hereinbelow with reference to Table 1.

[73579] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2119 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2119 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73580] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2119 gene, herein designated VGAM is inhibition of expression of VGAM2119 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2119 correlate with, and may be deduced from, the identity of the target genes which VGAM2119 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73581] PRO2435 (Accession NM_018527) is a VGAM2119 host target gene. PRO2435 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO2435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2435 BINDING SITE, designated SEQ ID:20598, to the nucleotide sequence of VGAM2119 RNA, herein designated VGAM RNA, also designated SEQ ID:4830.

[73582] A function of VGAM2119 is therefore inhibition of PRO2435 (Accession NM_018527). Accordingly, utilities of VGAM2119 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with PRO2435. LOC143425 (Accession XM_113695) is another VGAM2119 host target gene. LOC143425 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143425, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143425 BINDING SITE, designated SEQ ID:42354, to the nucleotide sequence of VGAM2119 RNA, herein designated VGAM RNA, also designated SEQ ID:4830.

[73583] Another function of VGAM2119 is therefore inhibition of LOC143425 (Accession XM_113695). Accordingly, utilities of VGAM2119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143425. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2120 (VGAM2120) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73584] VGAM2120 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2120 was detected is described hereinabove with reference to Figs. 1-8.

[73585] VGAM2120 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM2120 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73586] VGAM2120 gene encodes a VGAM2120 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2120 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2120 precursor RNA is designated SEQ ID:2106, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2106 is located at position 214751 relative to the genome of Cowpox Virus.

[73587] VGAM2120 precursor RNA folds onto itself, forming VGAM2120 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73588] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2120 folded precursor RNA into VGAM2120 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2120 RNA is designated SEQ ID:4831, and is provided hereinbelow with reference to the sequence listing part.

[73589] VGAM2120 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2120 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2120 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73590] VGAM2120 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2120 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2120 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2120 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2120 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73591] The complementary binding of VGAM2120 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2120 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2120 host target RNA into VGAM2120 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73592] It is appreciated that VGAM2120 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2120 host target genes. The mRNA of each one of this plurality of VGAM2120 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2120 RNA, herein designated VGAM RNA, and which when bound by VGAM2120 RNA causes inhibition of translation of respective one or more VGAM2120 host target proteins.

[73593] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2120 gene, herein designated VGAM GENE, on one or more VGAM2120 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73594] It is yet further appreciated that a function of VGAM2120 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2120 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM2120 correlate with, and may be deduced from, the identity of the host target genes which VGAM2120 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73595] Nucleotide sequences of the VGAM2120 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM2120 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2120 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2120 are further described hereinbelow with reference to Table 1.

[73596] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2120 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2120 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73597] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2120 gene, herein designated VGAM is inhibition of expression of VGAM2120 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2120 correlate with, and may be deduced from, the identity of the target genes which VGAM2120 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73598] ATP-binding Cassette, Sub-family A (ABC1), Member 1 (ABCA1, Accession NM_005502) is a VGAM2120 host target gene. ABCA1 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by ABCA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCA1 BINDING SITE, designated SEQ ID:12012, to the nucleotide sequence of VGAM2120 RNA, herein designated VGAM RNA, also designated SEQ ID:4831.

[73599] A function of VGAM2120 is therefore inhibition of ATP-binding Cassette, Sub-family A (ABC1), Member 1 (ABCA1, Accession NM_005502), a gene which camp-dependent and sulfonylurea-sensitive anion transporter. Accordingly, utilities of VGAM2120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA1. The function of ABCA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1956.Ret Proto-oncogene (multiple endocrine neoplasia and medullary thyroid carcinoma 1, Hirschsprung disease) (RET, Accession NM_000323) is another VGAM2120 host target gene. RET BINDING SITE1 through RET BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA

encoded by RET, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RET BINDING SITE1 through RET BINDING SITE4, designated SEQ ID:5866, SEQ ID:21780, SEQ ID:21782 and SEQ ID:21959 respectively, to the nucleotide sequence of VGAM2120 RNA, herein designated VGAM RNA, also designated SEQ ID:4831.

[73600] Another function of VGAM2120 is therefore inhibition of Ret Proto-oncogene (multiple endocrine neoplasia and medullary thyroid carcinoma 1, Hirschsprung disease) (RET, Accession NM_000323), a gene which transduces signals for cell growth and differentiation. Accordingly, utilities of VGAM2120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RET. The function of RET and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381.KIAA1023 (Accession NM_017604) is another VGAM2120 host target gene. KIAA1023 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1023, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1023 BINDING SITE, designated SEQ ID:19086, to the nucleotide sequence of VGAM2120 RNA, herein designated VGAM RNA, also designated SEQ ID:4831.

[73601] Another function of VGAM2120 is therefore inhibition of KIAA1023 (Accession NM_017604). Accordingly, utilities of VGAM2120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1023. Uronyl-2-sulfotransferase (UST, Accession NM_005715) is another VGAM2120 host target gene. UST BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UST, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UST BINDING SITE, designated SEQ ID:12269, to the nucleotide sequence of VGAM2120 RNA, herein designated VGAM RNA, also designated SEQ ID:4831.

[73602] Another function of VGAM2120 is therefore inhibition of Uronyl-2-sulfotransferase (UST, Accession NM_005715). Accordingly, utilities of VGAM2120 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with UST. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2121 (VGAM2121) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73603] VGAM2121 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2121 was detected is described hereinabove with reference to Figs. 1-8.

[73604] VGAM2121 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM2121 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73605] VGAM2121 gene encodes a VGAM2121 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2121 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2121 precursor RNA is designated SEQ ID:2107, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2107 is located at position 6122 relative to the genome of Cowpox Virus.

[73606] VGAM2121 precursor RNA folds onto itself, forming VGAM2121 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73607] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2121 folded precursor RNA into VGAM2121 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2121 RNA is designated SEQ ID:4832, and is provided hereinbelow with reference to the sequence listing part.

[73608] VGAM2121 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2121 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2121 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73609] VGAM2121 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2121 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2121 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2121 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2121 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73610] The complementary binding of VGAM2121 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2121 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2121 host target RNA into VGAM2121 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73611] It is appreciated that VGAM2121 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2121 host target genes. The mRNA of each one of this plurality of VGAM2121 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2121 RNA, herein designated VGAM RNA, and which when bound by VGAM2121 RNA causes

inhibition of translation of respective one or more VGAM2121 host target proteins.

[73612] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2121 gene, herein designated VGAM GENE, on one or more VGAM2121 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73613] It is yet further appreciated that a function of VGAM2121 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2121 include diagnosis, prevention and

treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM2121 correlate with, and may be deduced from, the identity of the host target genes which VGAM2121 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73614] Nucleotide sequences of the VGAM2121 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2121 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2121 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2121 are further described hereinbelow with reference to Table 1.

[73615] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2121 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2121 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73616] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2121 gene, herein designated VGAM is inhibition of expression of VGAM2121 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2121 correlate with, and may be deduced from, the identity of the target genes which VGAM2121 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73617] FYVE and Coiled-coil Domain Containing 1 (FYCO1, Accession NM_024513) is a VGAM2121 host target gene. FYCO1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FYCO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FYCO1 BINDING SITE, designated SEQ ID:23712, to the nucleotide sequence of VGAM2121 RNA, herein designated VGAM RNA, also designated SEQ ID:4832.

[73618] A function of VGAM2121 is therefore inhibition of FYVE and Coiled-coil Domain Containing 1 (FYCO1, Accession NM_024513). Accordingly, utilities of VGAM2121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FYCO1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to

here as Viral Genomic Address Messenger 2122 (VGAM2122) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73619] VGAM2122 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2122 was detected is described hereinabove with reference to Figs. 1-8.

[73620] VGAM2122 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM2122 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73621] VGAM2122 gene encodes a VGAM2122 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2122 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2122 precursor RNA is designated SEQ ID:2108, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2108 is located at position 5631 relative to the genome of Cowpox Virus.

[73622] VGAM2122 precursor RNA folds onto itself, forming VGAM2122 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73623] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2122 folded precursor RNA into VGAM2122 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM2122 RNA is designated SEQ ID:4833, and is provided hereinbelow with reference to the sequence listing part.

[73624] VGAM2122 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2122 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2122 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73625] VGAM2122 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2122 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2122 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2122 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2122 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73626] The complementary binding of VGAM2122 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2122 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2122 host target RNA into VGAM2122 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73627] It is appreciated that VGAM2122 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2122 host target genes. The mRNA of each one of this plurality of VGAM2122 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2122 RNA, herein designated VGAM RNA, and which when bound by VGAM2122 RNA causes inhibition of translation of respective one or more VGAM2122 host target proteins.

[73628] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2122 gene, herein designated VGAM GENE, on one or more VGAM2122 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73629] It is yet further appreciated that a function of VGAM2122 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2122 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM2122 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2122 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73630] Nucleotide sequences of the VGAM2122 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2122 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2122 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2122 are further described hereinbelow with reference to Table 1.

[73631] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2122 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2122 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73632] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2122 gene, herein designated VGAM is inhibition of expression of VGAM2122 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2122 correlate with, and may be deduced from, the identity of the target genes which VGAM2122

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73633] Enoyl Coenzyme A Hydratase 1, Peroxisomal (ECH1, Accession XM_008904) is a VGAM2122 host target gene. ECH1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ECH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ECH1 BINDING SITE, designated SEQ ID:30097, to the nucleotide sequence of VGAM2122 RNA, herein designated VGAM RNA, also designated SEQ ID:4833.

[73634] A function of VGAM2122 is therefore inhibition of Enoyl Coenzyme A Hydratase 1, Peroxisomal (ECH1, Accession XM_008904). Accordingly, utilities of VGAM2122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ECH1. LOC203317 (Accession XM_114683) is another VGAM2122 host target gene. LOC203317 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC203317 BINDING SITE, designated SEQ ID:43030, to the nucleotide sequence of VGAM2122 RNA, herein designated VGAM RNA, also designated SEQ ID:4833.

[73635] Another function of VGAM2122 is therefore inhibition of LOC203317 (Accession XM_114683). Accordingly, utilities of VGAM2122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203317. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2123 (VGAM2123) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73636] VGAM2123 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2123 was detected is described hereinabove with reference to Figs. 1-8.

[73637] VGAM2123 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM2123 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[73638] VGAM2123 gene encodes a VGAM2123 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2123 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2123 precursor RNA is designated SEQ ID:2109, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2109 is located at position 208014 relative to the genome of Cowpox Virus.

[73639] VGAM2123 precursor RNA folds onto itself, forming VGAM2123 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73640] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2123 folded precursor RNA into VGAM2123 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2123 RNA is designated SEQ ID:4834, and is provided hereinbelow with reference to the sequence listing part.

[73641] VGAM2123 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2123 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2123 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73642] VGAM2123 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2123 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2123 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2123 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2123 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73643] The complementary binding of VGAM2123 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2123 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2123 host target RNA into VGAM2123 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73644] It is appreciated that VGAM2123 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2123 host target genes. The mRNA of each one of this plurality of VGAM2123 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2123 RNA, herein designated VGAM RNA, and which when bound by VGAM2123 RNA causes inhibition of translation of respective one or more VGAM2123 host target proteins.

[73645] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2123 gene, herein designated VGAM GENE, on one or more VGAM2123 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73646] It is yet further appreciated that a function of VGAM2123 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2123 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM2123 correlate with, and may be deduced from, the identity of the host target genes which VGAM2123 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73647] Nucleotide sequences of the VGAM2123 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2123 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2123 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2123 are further described hereinbelow with reference to Table 1.

[73648] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2123 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2123 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73649] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2123 gene, herein designated VGAM is inhibition of expression of VGAM2123 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2123 correlate with, and may be deduced from, the identity of the target genes which VGAM2123 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73650] Dachshund Homolog (Drosophila) (DACH, Accession NM_080759) is a VGAM2123 host target gene. DACH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DACH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DACH BINDING SITE, designated SEQ ID:28042, to the nucleotide sequence of VGAM2123 RNA, herein designated VGAM RNA, also designated SEQ ID:4834.

[73651] A function of VGAM2123 is therefore inhibition of Dachshund Homolog (Drosophila) (DACH, Accession NM_080759), a gene which regulates early progenitor cell proliferation during retinogenesis and pituitary development . Accordingly, utilities of VGAM2123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DACH. The function of DACH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM260.Fragile X Mental Retardation 1 (FMR1, Accession NM_002024) is another VGAM2123 host target gene. FMR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FMR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FMR1 BINDING SITE, designated SEQ ID:7776, to the nucleotide sequence of VGAM2123 RNA, herein designated VGAM RNA, also designated SEQ ID:4834.

[73652] Another function of VGAM2123 is therefore inhibition of Fragile X Mental Retardation 1 (FMR1, Accession NM_002024). Accordingly, utilities of VGAM2123 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with FMR1. Maltase-glucoamylase (alpha-glucosidase) (MGAM, Accession XM_051351) is another VGAM2123 host target gene. MGAM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAM BINDING SITE, designated SEQ ID:35822, to the nucleotide sequence of VGAM2123 RNA, herein designated VGAM RNA, also designated SEQ ID:4834.

[73653] Another function of VGAM2123 is therefore inhibition of Maltase-glucoamylase (alpha-glucosidase) (MGAM, Accession XM_051351), a gene which plays a role in the final steps of digestion of starch. Accordingly, utilities of VGAM2123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAM. The function of MGAM and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM791.MHC Class II Transactivator (MHC2TA, Ac-

cession NM_000246) is another VGAM2123 host target gene. MHC2TA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MHC2TA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MHC2TA BINDING SITE, designated SEQ ID:5784, to the nucleotide sequence of VGAM2123 RNA, herein designated VGAM RNA, also designated SEQ ID:4834.

[73654] Another function of VGAM2123 is therefore inhibition of MHC Class II Transactivator (MHC2TA, Accession NM_000246). Accordingly, utilities of VGAM2123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MHC2TA. Reserved (C8orf13, Accession XM_088377) is another VGAM2123 host target gene. C8orf13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C8orf13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf13 BINDING SITE, designated SEQ ID:39657, to the nucleotide sequence of

VGAM2123 RNA, herein designated VGAM RNA, also designated SEQ ID:4834.

[73655] Another function of VGAM2123 is therefore inhibition of Reserved (C8orf13, Accession XM_088377). Accordingly, utilities of VGAM2123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf13. FLJ11827 (Accession NM_025093) is another VGAM2123 host target gene. FLJ11827 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11827, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11827 BINDING SITE, designated SEQ ID:24723, to the nucleotide sequence of VGAM2123 RNA, herein designated VGAM RNA, also designated SEQ ID:4834.

[73656] Another function of VGAM2123 is therefore inhibition of FLJ11827 (Accession NM_025093). Accordingly, utilities of VGAM2123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11827. KIAA0472 (Accession XM_050147) is another VGAM2123 host target gene. KIAA0472 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by KIAA0472, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0472 BINDING SITE, designated SEQ ID:35583, to the nucleotide sequence of VGAM2123 RNA, herein designated VGAM RNA, also designated SEQ ID:4834.

[73657] Another function of VGAM2123 is therefore inhibition of KIAA0472 (Accession XM_050147). Accordingly, utilities of VGAM2123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0472. SRY (sex determining region Y)-box 6 (SOX6, Accession NM_033326) is another VGAM2123 host target gene. SOX6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SOX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX6 BINDING SITE, designated SEQ ID:27159, to the nucleotide sequence of VGAM2123 RNA, herein designated VGAM RNA, also designated SEQ ID:4834.

[73658] Another function of VGAM2123 is therefore inhibition of SRY (sex determining region Y)-box 6 (SOX6, Accession

NM_033326). Accordingly, utilities of VGAM2123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX6. LOC149276 (Accession XM_097621) is another VGAM2123 host target gene. LOC149276 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149276 BINDING SITE, designated SEQ ID:40977, to the nucleotide sequence of VGAM2123 RNA, herein designated VGAM RNA, also designated SEQ ID:4834.

[73659] Another function of VGAM2123 is therefore inhibition of LOC149276 (Accession XM_097621). Accordingly, utilities of VGAM2123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149276. LOC153910 (Accession XM_087801) is another VGAM2123 host target gene. LOC153910 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153910, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC153910 BINDING SITE, designated SEQ ID:39441, to the nucleotide sequence of VGAM2123 RNA, herein designated VGAM RNA, also designated SEQ ID:4834.

[73660] Another function of VGAM2123 is therefore inhibition of LOC153910 (Accession XM_087801). Accordingly, utilities of VGAM2123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153910. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2124 (VGAM2124) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73661] VGAM2124 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2124 was detected is described hereinabove with reference to Figs. 1-8.

[73662] VGAM2124 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM2124 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[73663] VGAM2124 gene encodes a VGAM2124 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2124 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2124 precursor RNA is designated SEQ ID:2110, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2110 is located at position 205910 relative to the genome of Cowpox Virus.

[73664] VGAM2124 precursor RNA folds onto itself, forming VGAM2124 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73665] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2124 folded precursor RNA into VGAM2124 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM2124 RNA is designated SEQ ID:4835, and is provided hereinbelow with reference to the sequence listing part.

[73666] VGAM2124 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2124 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2124 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73667] VGAM2124 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2124 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2124 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2124 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2124 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73668] The complementary binding of VGAM2124 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2124 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2124 host target RNA into VGAM2124 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73669] It is appreciated that VGAM2124 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2124 host target genes. The mRNA of each one of this plurality of VGAM2124 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2124 RNA, herein designated VGAM RNA, and which when bound by VGAM2124 RNA causes inhibition of translation of respective one or more VGAM2124 host target proteins.

[73670] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2124 gene, herein designated VGAM GENE, on one or more VGAM2124 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73671] It is yet further appreciated that a function of VGAM2124 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM2124 correlate with, and may be deduced from, the identity of the host target genes which VGAM2124 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73672] Nucleotide sequences of the VGAM2124 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2124 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2124 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2124 are further described hereinbelow with reference to Table 1.

[73673] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM2124 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2124 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73674] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2124 gene, herein designated VGAM is inhibition of expression of VGAM2124 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2124 correlate with, and may be deduced from, the identity of the target genes which VGAM2124 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73675] Elongation of Very Long Chain Fatty Acids (FEN1/Elo2, SUR4/Elo3, yeast)-like 4 (ELOVL4, Accession NM_022726) is a VGAM2124 host target gene. ELOVL4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ELOVL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELOVL4 BINDING SITE, designated SEQ ID:22928, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM

RNA, also designated SEQ ID:4835.

[73676] A function of VGAM2124 is therefore inhibition of Elongation of Very Long Chain Fatty Acids (FEN1/Elo2, SUR4/Elo3, yeast)-like 4 (ELOVL4, Accession NM_022726). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELOVL4. Glutaminase (GLS, Accession NM_014905) is another VGAM2124 host target gene. GLS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GLS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLS BINDING SITE, designated SEQ ID:17110, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73677] Another function of VGAM2124 is therefore inhibition of Glutaminase (GLS, Accession NM_014905). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLS. Homeo Box C5 (HOXC5, Accession NM_018953) is another VGAM2124 host target gene. HOXC5 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by HOXC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXC5 BINDING SITE, designated SEQ ID:21022, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73678] Another function of VGAM2124 is therefore inhibition of Homeo Box C5 (HOXC5, Accession NM_018953). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXC5. Insulin-like Growth Factor Binding Protein 3 (IGFBP3, Accession NM_000598) is another VGAM2124 host target gene. IGFBP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IGFBP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGFBP3 BINDING SITE, designated SEQ ID:6199, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73679] Another function of VGAM2124 is therefore inhibition of

Insulin-like Growth Factor Binding Protein 3 (IGFBP3, Accession NM_000598). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGFBP3. Lamin B Receptor (LBR, Accession XM_001795) is another VGAM2124 host target gene. LBR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LBR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LBR BINDING SITE, designated SEQ ID:29851, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73680] Another function of VGAM2124 is therefore inhibition of Lamin B Receptor (LBR, Accession XM_001795). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LBR. PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM_015866) is another VGAM2124 host target gene. PRDM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRDM2, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM2 BINDING SITE, designated SEQ ID:18007, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73681] Another function of VGAM2124 is therefore inhibition of PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM_015866), a gene which plays a role in transcriptional regulation during neuronal differentiation and pathogenesis of retinoblastoma. Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM2. The function of PRDM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120.Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 7 (SLC4A7, Accession NM_003615) is another VGAM2124 host target gene. SLC4A7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC4A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of SLC4A7 BINDING SITE, designated SEQ ID:9673, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73682] Another function of VGAM2124 is therefore inhibition of Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 7 (SLC4A7, Accession NM_003615), a gene which mediates the coupled movement of sodium and bicarbonate ions across the plasma membrane. Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A7. The function of SLC4A7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM66.Sorting Nexin 6 (SNX6, Accession NM_021249) is another VGAM2124 host target gene. SNX6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SNX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNX6 BINDING SITE, designated SEQ

ID:22219, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73683] Another function of VGAM2124 is therefore inhibition of Sorting Nexin 6 (SNX6, Accession NM_021249). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX6. Thymidine Kinase 2, Mitochondrial (TK2, Accession NM_004614) is another VGAM2124 host target gene. TK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TK2 BINDING SITE, designated SEQ ID:10960, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73684] Another function of VGAM2124 is therefore inhibition of Thymidine Kinase 2, Mitochondrial (TK2, Accession NM_004614), a gene which phosphorylates thymidine, deoxycytidine, deoxyuridine, and also anti-viral and anti-cancer nucleoside analogs. Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with TK2. The function of TK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM210.Tropomodulin 2 (neuronal) (TMOD2, Accession NM_014548) is another VGAM2124 host target gene. TMOD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TMOD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMOD2 BINDING SITE, designated SEQ ID:15860, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73685] Another function of VGAM2124 is therefore inhibition of Tropomodulin 2 (neuronal) (TMOD2, Accession NM_014548), a gene which is an actin-capping protein for the slow-growing end of filamentous actin. Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMOD2. The function of TMOD2 and its association with various diseases and clinical conditions, has been es-

tablished by previous studies, as described hereinabove with reference to VGAM791.WAS Protein Family, Member 3 (WASF3, Accession NM_006646) is another VGAM2124 host target gene. WASF3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by WASF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WASF3 BINDING SITE, designated SEQ ID:13445, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73686] Another function of VGAM2124 is therefore inhibition of WAS Protein Family, Member 3 (WASF3, Accession NM_006646), a gene which stimulates actin polymerization. Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WASF3. The function of WASF3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1692.Chromosome 11 Open Reading Frame 21 (C11orf21, Accession NM_014144) is another VGAM2124

host target gene. C11orf21 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C11orf21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf21 BINDING SITE, designated SEQ ID:15428, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73687] Another function of VGAM2124 is therefore inhibition of Chromosome 11 Open Reading Frame 21 (C11orf21, Accession NM_014144). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf21. DnaJ (Hsp40) Homolog, Subfamily A, Member 3 (DNAJA3, Accession XM_017984) is another VGAM2124 host target gene. DNAJA3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DNAJA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAJA3 BINDING SITE, designated SEQ ID:30335, to the nucleotide sequence of VGAM2124 RNA,

herein designated VGAM RNA, also designated SEQ ID:4835.

[73688] Another function of VGAM2124 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily A, Member 3 (DNAJA3, Accession XM_017984). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJA3. FLJ12761 (Accession NM_024545) is another VGAM2124 host target gene. FLJ12761 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12761, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12761 BINDING SITE, designated SEQ ID:23758, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73689] Another function of VGAM2124 is therefore inhibition of FLJ12761 (Accession NM_024545). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12761. FLJ12788 (Accession NM_022492) is another VGAM2124 host target gene. FLJ12788 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12788, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12788 BINDING SITE, designated SEQ ID:22874, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73690] Another function of VGAM2124 is therefore inhibition of FLJ12788 (Accession NM_022492). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12788. FLJ20783 (Accession NM_017958) is another VGAM2124 host target gene. FLJ20783 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20783, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20783 BINDING SITE, designated SEQ ID:19672, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73691] Another function of VGAM2124 is therefore inhibition of

FLJ20783 (Accession NM_017958). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20783. KIAA0179 (Accession XM_035973) is another VGAM2124 host target gene. KIAA0179 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0179 BINDING SITE, designated SEQ ID:32368, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73692] Another function of VGAM2124 is therefore inhibition of KIAA0179 (Accession XM_035973). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0179. KIAA1209 (Accession XM_027307) is another VGAM2124 host target gene. KIAA1209 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1209, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1209 BINDING SITE, designated SEQ ID:30474, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73693] Another function of VGAM2124 is therefore inhibition of KIAA1209 (Accession XM_027307). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1209. KIAA1432 (Accession XM_039698) is another VGAM2124 host target gene. KIAA1432 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1432 BINDING SITE, designated SEQ ID:33156, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73694] Another function of VGAM2124 is therefore inhibition of KIAA1432 (Accession XM_039698). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1432. KIAA1582 (Accession XM_037262) is another

VGAM2124 host target gene. KIAA1582 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1582, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1582 BINDING SITE, designated SEQ ID:32592, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73695] Another function of VGAM2124 is therefore inhibition of KIAA1582 (Accession XM_037262). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1582. KIAA1804 (Accession XM_045864) is another VGAM2124 host target gene. KIAA1804 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1804, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1804 BINDING SITE, designated SEQ ID:34590, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73696] Another function of VGAM2124 is therefore inhibition of KIAA1804 (Accession XM_045864). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1804. MGC21636 (Accession NM_145032) is another VGAM2124 host target gene. MGC21636 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC21636, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC21636 BINDING SITE, designated SEQ ID:29648, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73697] Another function of VGAM2124 is therefore inhibition of MGC21636 (Accession NM_145032). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC21636. MGC5149 (Accession XM_051200) is another VGAM2124 host target gene. MGC5149 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC5149, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5149 BINDING SITE, designated SEQ ID:35785, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73698] Another function of VGAM2124 is therefore inhibition of MGC5149 (Accession XM_051200). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5149. Ring Finger Protein (C3HC4 type) 8 (RNF8, Accession NM_003958) is another VGAM2124 host target gene. RNF8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF8 BINDING SITE, designated SEQ ID:10098, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73699] Another function of VGAM2124 is therefore inhibition of Ring Finger Protein (C3HC4 type) 8 (RNF8, Accession NM_003958). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with RNF8. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3C (SEMA3C, Accession NM_006379) is another VGAM2124 host target gene. SEMA3C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEMA3C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3C BINDING SITE, designated SEQ ID:13075, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73700] Another function of VGAM2124 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3C (SEMA3C, Accession NM_006379). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3C. SHAPY (Accession NM_138793) is another VGAM2124 host target gene. SHAPY BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SHAPY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of SHAPY BINDING SITE, designated SEQ ID:29017, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73701] Another function of VGAM2124 is therefore inhibition of SHAPY (Accession NM_138793). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHAPY. Stromal Antigen 2 (STAG2, Accession XM_047285) is another VGAM2124 host target gene. STAG2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STAG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAG2 BINDING SITE, designated SEQ ID:34930, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73702] Another function of VGAM2124 is therefore inhibition of Stromal Antigen 2 (STAG2, Accession XM_047285). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with STAG2. Yes-associated Protein 1, 65kDa (YAP1, Accession NM_006106) is another VGAM2124 host target gene. YAP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by YAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YAP1 BINDING SITE, designated SEQ ID:12755, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73703] Another function of VGAM2124 is therefore inhibition of Yes-associated Protein 1, 65kDa (YAP1, Accession NM_006106). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YAP1. Zinc Finger RNA Binding Protein (ZFR, Accession NM_016107) is another VGAM2124 host target gene. ZFR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFR BINDING SITE, desig-

nated SEQ ID:18189, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73704] Another function of VGAM2124 is therefore inhibition of Zinc Finger RNA Binding Protein (ZFR, Accession NM_016107). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFR. Zinc Finger Protein 294 (ZNF294, Accession XM_047829) is another VGAM2124 host target gene. ZNF294 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF294 BINDING SITE, designated SEQ ID:35057, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73705] Another function of VGAM2124 is therefore inhibition of Zinc Finger Protein 294 (ZNF294, Accession XM_047829). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF294. LOC118706 (Accession

XM_058336) is another VGAM2124 host target gene. LOC118706 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC118706, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118706 BINDING SITE, designated SEQ ID:36597, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73706] Another function of VGAM2124 is therefore inhibition of LOC118706 (Accession XM_058336). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118706. LOC127428 (Accession XM_059144) is another VGAM2124 host target gene. LOC127428 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC127428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127428 BINDING SITE, designated SEQ ID:36898, to the nucleotide sequence of VGAM2124 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4835.

[73707] Another function of VGAM2124 is therefore inhibition of LOC127428 (Accession XM_059144). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127428. LOC133686 (Accession XM_059667) is another VGAM2124 host target gene. LOC133686 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC133686, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133686 BINDING SITE, designated SEQ ID:37057, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73708] Another function of VGAM2124 is therefore inhibition of LOC133686 (Accession XM_059667). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133686. LOC143158 (Accession XM_084445) is another VGAM2124 host target gene. LOC143158 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC143158, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143158 BINDING SITE, designated SEQ ID:37592, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73709] Another function of VGAM2124 is therefore inhibition of LOC143158 (Accession XM_084445). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143158. LOC144438 (Accession XM_084860) is another VGAM2124 host target gene. LOC144438 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144438 BINDING SITE, designated SEQ ID:37739, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73710] Another function of VGAM2124 is therefore inhibition of LOC144438 (Accession XM_084860). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC144438. LOC145820 (Accession XM_085246) is another VGAM2124 host target gene. LOC145820 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145820 BINDING SITE, designated SEQ ID:37993, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73711] Another function of VGAM2124 is therefore inhibition of LOC145820 (Accession XM_085246). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145820. LOC147160 (Accession XM_097202) is another VGAM2124 host target gene. LOC147160 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147160 BINDING SITE, designated SEQ ID:40809, to

the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73712] Another function of VGAM2124 is therefore inhibition of LOC147160 (Accession XM_097202). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147160. LOC147463 (Accession XM_085799) is another VGAM2124 host target gene. LOC147463 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147463 BINDING SITE, designated SEQ ID:38342, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73713] Another function of VGAM2124 is therefore inhibition of LOC147463 (Accession XM_085799). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147463. LOC159053 (Accession XM_099021) is another VGAM2124 host target gene. LOC159053 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC159053, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159053 BINDING SITE, designated SEQ ID:42060, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73714] Another function of VGAM2124 is therefore inhibition of LOC159053 (Accession XM_099021). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159053. LOC201931 (Accession XM_114407) is another VGAM2124 host target gene. LOC201931 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201931, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201931 BINDING SITE, designated SEQ ID:42930, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73715] Another function of VGAM2124 is therefore inhibition of LOC201931 (Accession XM_114407). Accordingly, utilities

of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201931. LOC220466 (Accession XM_058363) is another VGAM2124 host target gene. LOC220466 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220466 BINDING SITE, designated SEQ ID:36611, to the nucleotide sequence of VGAM2124 RNA, herein designated VGAM RNA, also designated SEQ ID:4835.

[73716] Another function of VGAM2124 is therefore inhibition of LOC220466 (Accession XM_058363). Accordingly, utilities of VGAM2124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220466. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2125 (VGAM2125) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73717] VGAM2125 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2125 was detected is described hereinabove with reference to Figs. 1-8.

[73718] VGAM2125 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline Herpesvirus 3. VGAM2125 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73719] VGAM2125 gene encodes a VGAM2125 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2125 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2125 precursor RNA is designated SEQ ID:2111, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2111 is located at position 18618 relative to the genome of Ateline Herpesvirus 3.

[73720] VGAM2125 precursor RNA folds onto itself, forming VGAM2125 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73721] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2125 folded precursor RNA into VGAM2125 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM2125 RNA is designated SEQ ID:4836, and is provided hereinbelow with reference to the sequence listing part.

[73722] VGAM2125 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2125 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2125 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[73723] VGAM2125 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2125 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2125 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2125 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2125 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73724] The complementary binding of VGAM2125 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2125 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2125 host target RNA into VGAM2125 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73725] It is appreciated that VGAM2125 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2125 host target genes. The mRNA of each one of this plurality of VGAM2125 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2125 RNA, herein designated VGAM RNA, and which when bound by VGAM2125 RNA causes inhibition of translation of respective one or more VGAM2125 host target proteins.

[73726] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2125 gene, herein designated VGAM GENE, on one or more VGAM2125 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73727] It is yet further appreciated that a function of VGAM2125 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2125 include diagnosis, prevention and treatment of viral infection by Ateline Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2125 correlate with, and may be deduced from, the identity of the host target genes which VGAM2125 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73728] Nucleotide sequences of the VGAM2125 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2125 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2125 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2125 are further described hereinbelow with reference to Table 1.

[73729] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2125 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2125 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73730] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2125 gene, herein designated VGAM is inhibition of expression of VGAM2125 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2125 correlate with, and may be deduced from, the identity of the target genes which VGAM2125 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73731] Angiotensin I Converting Enzyme (peptidyl-dipeptidase A) 2 (ACE2, Accession NM_021804) is a VGAM2125 host tar-

get gene. ACE2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ACE2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACE2 BINDING SITE, designated SEQ ID:22356, to the nucleotide sequence of VGAM2125 RNA, herein designated VGAM RNA, also designated SEQ ID:4836.

[73732] A function of VGAM2125 is therefore inhibition of Angiotensin I Converting Enzyme (peptidyl-dipeptidase A) 2 (ACE2, Accession NM_021804), a gene which converts angiotensin i to angiotensin ii by release of the terminal his-leu. Accordingly, utilities of VGAM2125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACE2. The function of ACE2 has been established by previous studies. By EST database searching for sequences showing homology to the zinc metalloprotease angiotensin I converting enzyme (ACE; 106180) and by screening a human lymphoma cDNA library, Tipnis et al. (2000) cloned a full-length ACE2 cDNA, which they called ACEH, encoding a deduced 805-amino acid protein that shares approximately 40% identity with the N- and C-terminal domains of ACE. ACE2 contains a

potential 17-amino acid N-terminal signal peptide and a putative 22-amino acid C-terminal membrane anchor. It has a conserved zinc metalloprotease consensus sequence (HEXXH) and a conserved glutamine residue that is predicted to serve as a third zinc ligand. Northern blot analysis detected high expression of ACE2 in kidney, testis, and heart, and moderate expression in colon, small intestine, and ovary. Expression in CHO cells of a soluble, truncated form of ACE2, lacking transmembrane and cytosolic domains, produced a glycosylated protein that is able to cleave angiotensin I and angiotensin II but not bradykinin. In the hydrolysis of the angiotensins, ACE2 functions exclusively as a carboxypeptidase. Tipnis et al. (2000) showed that ACE2 is not inhibited by benzylsuccinate, a carboxypeptidase A inhibitor, or by other ACE inhibitors such as lisinopril. Tipnis et al. (2000) mapped the ACE2 gene by sequence similarity to a sequence in GenBank (AC003669) mapping to Xp22. Animal model experiments lend further support to the function of ACE2. Crackower et al. (2002) demonstrated that Ace2 maps to a defined quantitative trait locus (QTL) on the X chromosome in 3 different rat models of hypertension. In all hypertensive rat strains, Ace2 mRNA and protein expression were

markedly reduced, suggesting that Ace2 is a candidate gene for this QTL.

[73733] It is appreciated that the abovementioned animal model for ACE2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[73734] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[73735] Tipnis, S. R.; Hooper, N. M.; Hyde, R.; Karran, E.; Christie, G.; Turner, A. J. : A human homolog of angiotensin-converting enzyme: cloning and functional expression as a captopril-insensitive carboxypeptidase. J. Biol. Chem. 275: 33238-33243, 2000. ; and

[73736] Crackower, M. A.; Sarao, R.; Oudit, G. Y.; Yagil, C.; Kozieradzki, I.; Scanga, S. E.; Oliveira-dos-Santos, A. J.; da Costa, J.; Zhang, L.; Pei, Y.; Scholey, J.; Ferrario, C. M.; Manouki.

[73737] Further studies establishing the function and utilities of ACE2 are found in John Hopkins OMIM database record ID 300335, and in sited publications numbered 9447 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Mitogen-activated Pro-

tein Kinase Kinase Kinase 5 (MAP3K5, Accession NM_005923) is another VGAM2125 host target gene. MAP3K5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAP3K5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K5 BINDING SITE, designated SEQ ID:12546, to the nucleotide sequence of VGAM2125 RNA, herein designated VGAM RNA, also designated SEQ ID:4836.

[73738] Another function of VGAM2125 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 5 (MAP3K5, Accession NM_005923), a gene which phosphorylates and activates two different subgroups of map kinase kinases, mkk4/sek1 and mkk3/mapkk6 (or mkk6) .overexpression induces apoptotic cell death. Accordingly, utilities of VGAM2125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K5. The function of MAP3K5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1622.Aminopeptidase Puromycin

Sensitive (NPEPPS, Accession NM_006310) is another VGAM2125 host target gene. NPEPPS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NPEPPS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPEPPS BINDING SITE, designated SEQ ID:12996, to the nucleotide sequence of VGAM2125 RNA, herein designated VGAM RNA, also designated SEQ ID:4836.

[73739] Another function of VGAM2125 is therefore inhibition of Aminopeptidase Puromycin Sensitive (NPEPPS, Accession NM_006310), a gene which is puromycin-sensitive aminopeptidase and has metallopeptidase activity. Accordingly, utilities of VGAM2125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPEPPS. The function of NPEPPS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM83.Protein Kinase, AMP-activated, Alpha 2 Catalytic Subunit (PRKAA2, Accession NM_006252) is another VGAM2125 host target gene. PRKAA2 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by PRKAA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKAA2 BINDING SITE, designated SEQ ID:12927, to the nucleotide sequence of VGAM2125 RNA, herein designated VGAM RNA, also designated SEQ ID:4836.

[73740] Another function of VGAM2125 is therefore inhibition of Protein Kinase, AMP-activated, Alpha 2 Catalytic Subunit (PRKAA2, Accession NM_006252), a gene which are responsible for the regulation of fatty acid synthesis by phosphorylation of acetyl-coa carboxylase. Accordingly, utilities of VGAM2125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKAA2. The function of PRKAA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1544.Prostaglandin-endoperoxide Synthase 2 (prostaglandin G/H synthase and cyclooxygenase) (PTGS2, Accession NM_000963) is another VGAM2125 host target gene. PTGS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by PTGS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGS2 BINDING SITE, designated SEQ ID:6681, to the nucleotide sequence of VGAM2125 RNA, herein designated VGAM RNA, also designated SEQ ID:4836.

[73741] Another function of VGAM2125 is therefore inhibition of Prostaglandin-endoperoxide Synthase 2 (prostaglandin G/H synthase and cyclooxygenase) (PTGS2, Accession NM_000963), a gene which may have a role as a major mediator of inflammation and/or a role for prostanoid signaling in activity-dependent plasticity. Accordingly, utilities of VGAM2125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGS2. The function of PTGS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM292.Chromosome 6 Open Reading Frame 35 (C6orf35, Accession NM_018452) is another VGAM2125 host target gene. C6orf35 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C6orf35, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf35 BINDING SITE, designated SEQ ID:20526, to the nucleotide sequence of VGAM2125 RNA, herein designated VGAM RNA, also designated SEQ ID:4836.

[73742] Another function of VGAM2125 is therefore inhibition of Chromosome 6 Open Reading Frame 35 (C6orf35, Accession NM_018452). Accordingly, utilities of VGAM2125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf35. FLJ20730 (Accession NM_017945) is another VGAM2125 host target gene. FLJ20730 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20730, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20730 BINDING SITE, designated SEQ ID:19639, to the nucleotide sequence of VGAM2125 RNA, herein designated VGAM RNA, also designated SEQ ID:4836.

[73743] Another function of VGAM2125 is therefore inhibition of FLJ20730 (Accession NM_017945). Accordingly, utilities of

VGAM2125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20730. FLJ22833 (Accession NM_022837) is another VGAM2125 host target gene. FLJ22833 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22833, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22833 BINDING SITE, designated SEQ ID:23119, to the nucleotide sequence of VGAM2125 RNA, herein designated VGAM RNA, also designated SEQ ID:4836.

[73744] Another function of VGAM2125 is therefore inhibition of FLJ22833 (Accession NM_022837). Accordingly, utilities of VGAM2125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22833. FLJ23462 (Accession NM_024843) is another VGAM2125 host target gene. FLJ23462 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23462

BINDING SITE, designated SEQ ID:24258, to the nucleotide sequence of VGAM2125 RNA, herein designated VGAM RNA, also designated SEQ ID:4836.

[73745] Another function of VGAM2125 is therefore inhibition of FLJ23462 (Accession NM_024843). Accordingly, utilities of VGAM2125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23462. MADP-1 (Accession NM_033114) is another VGAM2125 host target gene. MADP-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MADP-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MADP-1 BINDING SITE, designated SEQ ID:26961, to the nucleotide sequence of VGAM2125 RNA, herein designated VGAM RNA, also designated SEQ ID:4836.

[73746] Another function of VGAM2125 is therefore inhibition of MADP-1 (Accession NM_033114). Accordingly, utilities of VGAM2125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MADP-1. MCM10 Minichromosome Maintenance Deficient 10 (S. cerevisiae) (MCM10, Accession NM_018518) is another

VGAM2125 host target gene. MCM10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MCM10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCM10 BINDING SITE, designated SEQ ID:20591, to the nucleotide sequence of VGAM2125 RNA, herein designated VGAM RNA, also designated SEQ ID:4836.

[73747] Another function of VGAM2125 is therefore inhibition of MCM10 Minichromosome Maintenance Deficient 10 (S. cerevisiae) (MCM10, Accession NM_018518). Accordingly, utilities of VGAM2125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCM10. Phospholipase C-like 1 (PLCL1, Accession NM_006226) is another VGAM2125 host target gene. PLCL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLCL1 BINDING SITE, designated SEQ ID:12888, to the nucleotide sequence of VGAM2125 RNA,

herein designated VGAM RNA, also designated SEQ ID:4836.

[73748] Another function of VGAM2125 is therefore inhibition of Phospholipase C-like 1 (PLCL1, Accession NM_006226). Accordingly, utilities of VGAM2125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLCL1. LOC151473 (Accession XM_087215) is another VGAM2125 host target gene. LOC151473 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151473, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151473 BINDING SITE, designated SEQ ID:39117, to the nucleotide sequence of VGAM2125 RNA, herein designated VGAM RNA, also designated SEQ ID:4836.

[73749] Another function of VGAM2125 is therefore inhibition of LOC151473 (Accession XM_087215). Accordingly, utilities of VGAM2125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151473. LOC162461 (Accession XM_091568) is another VGAM2125 host target gene. LOC162461 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC162461, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162461 BINDING SITE, designated SEQ ID:40056, to the nucleotide sequence of VGAM2125 RNA, herein designated VGAM RNA, also designated SEQ ID:4836.

[73750] Another function of VGAM2125 is therefore inhibition of LOC162461 (Accession XM_091568). Accordingly, utilities of VGAM2125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162461. LOC220776 (Accession XM_043388) is another VGAM2125 host target gene. LOC220776 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220776 BINDING SITE, designated SEQ ID:33926, to the nucleotide sequence of VGAM2125 RNA, herein designated VGAM RNA, also designated SEQ ID:4836.

[73751] Another function of VGAM2125 is therefore inhibition of

LOC220776 (Accession XM_043388). Accordingly, utilities of VGAM2125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220776. LOC253019 (Accession XM_170907) is another VGAM2125 host target gene. LOC253019 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253019, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253019 BINDING SITE, designated SEQ ID:45665, to the nucleotide sequence of VGAM2125 RNA, herein designated VGAM RNA, also designated SEQ ID:4836.

[73752] Another function of VGAM2125 is therefore inhibition of LOC253019 (Accession XM_170907). Accordingly, utilities of VGAM2125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253019. LOC253975 (Accession XM_171130) is another VGAM2125 host target gene. LOC253975 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253975, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC253975 BINDING SITE, designated SEQ ID:45932, to the nucleotide sequence of VGAM2125 RNA, herein designated VGAM RNA, also designated SEQ ID:4836.

[73753] Another function of VGAM2125 is therefore inhibition of LOC253975 (Accession XM_171130). Accordingly, utilities of VGAM2125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253975. LOC85479 (Accession NM_033105) is another VGAM2125 host target gene. LOC85479 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC85479, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC85479 BINDING SITE, designated SEQ ID:26955, to the nucleotide sequence of VGAM2125 RNA, herein designated VGAM RNA, also designated SEQ ID:4836.

[73754] Another function of VGAM2125 is therefore inhibition of LOC85479 (Accession NM_033105). Accordingly, utilities of VGAM2125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC85479. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2126 (VGAM2126) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73755] VGAM2126 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2126 was detected is described hereinabove with reference to Figs. 1-8.

[73756] VGAM2126 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline Herpesvirus 3. VGAM2126 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73757] VGAM2126 gene encodes a VGAM2126 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2126 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2126 precursor RNA is designated SEQ ID:2112, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2112 is located at position 6412 relative to the genome of Ateline Herpesvirus 3.

[73758] VGAM2126 precursor RNA folds onto itself, forming VGAM2126 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73759] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2126 folded precursor RNA into VGAM2126 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2126 RNA is designated SEQ ID:4837, and is provided hereinbelow with reference to the sequence listing part.

[73760] VGAM2126 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2126 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2126 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73761] VGAM2126 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2126 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2126 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2126 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2126 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73762] The complementary binding of VGAM2126 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2126 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2126 host target RNA into VGAM2126 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73763] It is appreciated that VGAM2126 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2126 host target genes. The mRNA of each one of this plurality of VGAM2126 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2126 RNA, herein designated VGAM RNA, and which when bound by VGAM2126 RNA causes inhibition of translation of respective one or more

VGAM2126 host target proteins.

[73764] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2126 gene, herein designated VGAM GENE, on one or more VGAM2126 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73765] It is yet further appreciated that a function of VGAM2126 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2126 include diagnosis, prevention and treatment of viral infection by Ateline Herpesvirus 3. Spe-

cific functions, and accordingly utilities, of VGAM2126 correlate with, and may be deduced from, the identity of the host target genes which VGAM2126 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73766] Nucleotide sequences of the VGAM2126 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2126 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2126 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2126 are further described hereinbelow with reference to Table 1.

[73767] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2126 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2126 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73768] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2126 gene, herein designated VGAM is inhibition of expression of VGAM2126 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2126 correlate with, and may be deduced from, the identity of the target genes which VGAM2126 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73769] Amyloid Beta Precursor Protein (cytoplasmic tail) Binding Protein 2 (APPBP2, Accession NM_006380) is a VGAM2126 host target gene. APPBP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APPBP2 BINDING SITE, designated SEQ ID:13083, to the nucleotide sequence of VGAM2126 RNA, herein designated VGAM RNA, also designated SEQ ID:4837.

[73770] A function of VGAM2126 is therefore inhibition of Amyloid Beta Precursor Protein (cytoplasmic tail) Binding Protein 2 (APPBP2, Accession NM_006380), a gene which interacts with the basolateral sorting signal of amyloid precursor protein. Accordingly, utilities of VGAM2126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APPBP2. The function of APPBP2 and its association with various diseases and clin-

ical conditions, has been established by previous studies, as described hereinabove with reference to VGAM525.Aquaporin 6, Kidney Specific (AQP6, Accession NM_001652) is another VGAM2126 host target gene. AQP6 BINDING SITE1 and AQP6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AQP6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AQP6 BINDING SITE1 and AQP6 BINDING SITE2, designated SEQ ID:7360 and SEQ ID:27617 respectively, to the nucleotide sequence of VGAM2126 RNA, herein designated VGAM RNA, also designated SEQ ID:4837.

[73771] Another function of VGAM2126 is therefore inhibition of Aquaporin 6, Kidney Specific (AQP6, Accession NM_001652), a gene which participates in distinct physiologic function such as glomerular filtration, tubular endocytosis, and acid-base metabolism. Accordingly, utilities of VGAM2126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP6. The function of AQP6 and its association with various diseases and clinical conditions, has been established

by previous studies, as described hereinabove with reference to VGAM340.RPP30 (Accession NM_006413) is another VGAM2126 host target gene. RPP30 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RPP30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPP30 BINDING SITE, designated SEQ ID:13122, to the nucleotide sequence of VGAM2126 RNA, herein designated VGAM RNA, also designated SEQ ID:4837.

[73772] Another function of VGAM2126 is therefore inhibition of RPP30 (Accession NM_006413), a gene which is a component of ribonuclease p that processes 5' ends of precursor tRNAs. Accordingly, utilities of VGAM2126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPP30. The function of RPP30 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM230.Kell Blood Group Precursor (McLeod phenotype) (XK, Accession NM_021083) is another VGAM2126 host target gene. XK BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by XK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XK BINDING SITE, designated SEQ ID:22064, to the nucleotide sequence of VGAM2126 RNA, herein designated VGAM RNA, also designated SEQ ID:4837.

[73773] Another function of VGAM2126 is therefore inhibition of Kell Blood Group Precursor (McLeod phenotype) (XK, Accession NM_021083). Accordingly, utilities of VGAM2126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XK. HCA4 (Accession XM_085287) is another VGAM2126 host target gene. HCA4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HCA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCA4 BINDING SITE, designated SEQ ID:38029, to the nucleotide sequence of VGAM2126 RNA, herein designated VGAM RNA, also designated SEQ ID:4837.

[73774] Another function of VGAM2126 is therefore inhibition of HCA4 (Accession XM_085287). Accordingly, utilities of

VGAM2126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCA4. KIAA0635 (Accession NM_014645) is another VGAM2126 host target gene. KIAA0635 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0635, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0635 BINDING SITE, designated SEQ ID:16058, to the nucleotide sequence of VGAM2126 RNA, herein designated VGAM RNA, also designated SEQ ID:4837.

[73775] Another function of VGAM2126 is therefore inhibition of KIAA0635 (Accession NM_014645). Accordingly, utilities of VGAM2126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0635. LOC158219 (Accession XM_088514) is another VGAM2126 host target gene. LOC158219 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC158219 BINDING SITE, designated SEQ ID:39763, to the nucleotide sequence of VGAM2126 RNA, herein designated VGAM RNA, also designated SEQ ID:4837.

[73776] Another function of VGAM2126 is therefore inhibition of LOC158219 (Accession XM_088514). Accordingly, utilities of VGAM2126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158219. LOC158434 (Accession XM_098939) is another VGAM2126 host target gene. LOC158434 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158434 BINDING SITE, designated SEQ ID:41989, to the nucleotide sequence of VGAM2126 RNA, herein designated VGAM RNA, also designated SEQ ID:4837.

[73777] Another function of VGAM2126 is therefore inhibition of LOC158434 (Accession XM_098939). Accordingly, utilities of VGAM2126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158434. LOC221337 (Accession XM_166387) is another VGAM2126 host target gene. LOC221337 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221337 BINDING SITE, designated SEQ ID:44237, to the nucleotide sequence of VGAM2126 RNA, herein designated VGAM RNA, also designated SEQ ID:4837.

[73778] Another function of VGAM2126 is therefore inhibition of LOC221337 (Accession XM_166387). Accordingly, utilities of VGAM2126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221337. LOC256021 (Accession XM_172884) is another VGAM2126 host target gene. LOC256021 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256021 BINDING SITE, designated SEQ ID:46165, to the nucleotide sequence of VGAM2126 RNA, herein designated VGAM RNA, also designated SEQ ID:4837.

[73779] Another function of VGAM2126 is therefore inhibition of

LOC256021 (Accession XM_172884). Accordingly, utilities of VGAM2126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256021. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2127 (VGAM2127) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73780] VGAM2127 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2127 was detected is described hereinabove with reference to Figs. 1-8.

[73781] VGAM2127 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline Herpesvirus 3. VGAM2127 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73782] VGAM2127 gene encodes a VGAM2127 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2127 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2127 precursor RNA is designated SEQ ID:2113, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2113 is located at position 22317 relative to the genome of Ateline Herpesvirus 3.

[73783] VGAM2127 precursor RNA folds onto itself, forming VGAM2127 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73784] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2127 folded precursor RNA into VGAM2127 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide se-

quence of VGAM2127 RNA is designated SEQ ID:4838, and is provided hereinbelow with reference to the sequence listing part.

[73785] VGAM2127 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2127 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2127 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73786] VGAM2127 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2127 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2127 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2127 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2127 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73787] The complementary binding of VGAM2127 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2127 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2127 host target RNA into VGAM2127 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73788] It is appreciated that VGAM2127 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2127 host target genes. The mRNA of each one of this plurality of VGAM2127 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2127 RNA, herein designated VGAM RNA, and which when bound by VGAM2127 RNA causes inhibition of translation of respective one or more VGAM2127 host target proteins.

[73789] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2127 gene, herein designated VGAM GENE, on one or more VGAM2127 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73790] It is yet further appreciated that a function of VGAM2127

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2127 include diagnosis, prevention and treatment of viral infection by Ateline Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2127 correlate with, and may be deduced from, the identity of the host target genes which VGAM2127 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73791] Nucleotide sequences of the VGAM2127 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2127 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2127 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2127 are further described hereinbelow with reference to Table 1.

[73792] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2127 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2127 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73793] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2127 gene, herein designated VGAM is inhibition of expression of VGAM2127 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2127 correlate with, and may be deduced from, the identity of the target genes which VGAM2127 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73794] FLJ21615 (Accession NM_032205) is a VGAM2127 host target gene. FLJ21615 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21615 BINDING SITE, designated SEQ ID:25909, to the nucleotide sequence of VGAM2127 RNA, herein designated VGAM RNA, also designated SEQ ID:4838.

[73795] A function of VGAM2127 is therefore inhibition of FLJ21615 (Accession NM_032205). Accordingly, utilities of VGAM2127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21615. GABA(A) Receptors Associated Protein Like 3

(GABARAPL3, Accession NM_032568) is another VGAM2127 host target gene. GABARAPL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GABARAPL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABARAPL3 BINDING SITE, designated SEQ ID:26296, to the nucleotide sequence of VGAM2127 RNA, herein designated VGAM RNA, also designated SEQ ID:4838.

[73796] Another function of VGAM2127 is therefore inhibition of GABA(A) Receptors Associated Protein Like 3 (GABARAPL3, Accession NM_032568). Accordingly, utilities of VGAM2127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABARAPL3. KIAA0077 (Accession XM_040158) is another VGAM2127 host target gene. KIAA0077 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0077 BINDING SITE, designated SEQ ID:33267, to the

nucleotide sequence of VGAM2127 RNA, herein designated VGAM RNA, also designated SEQ ID:4838.

[73797] Another function of VGAM2127 is therefore inhibition of KIAA0077 (Accession XM_040158). Accordingly, utilities of VGAM2127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0077. KIAA0923 (Accession NM_014021) is another VGAM2127 host target gene. KIAA0923 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0923 BINDING SITE, designated SEQ ID:15240, to the nucleotide sequence of VGAM2127 RNA, herein designated VGAM RNA, also designated SEQ ID:4838.

[73798] Another function of VGAM2127 is therefore inhibition of KIAA0923 (Accession NM_014021). Accordingly, utilities of VGAM2127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0923. LAT1-3TM (Accession XM_043976) is another VGAM2127 host target gene. LAT1-3TM BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by LAT1-3TM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAT1-3TM BINDING SITE, designated SEQ ID:34053, to the nucleotide sequence of VGAM2127 RNA, herein designated VGAM RNA, also designated SEQ ID:4838.

[73799] Another function of VGAM2127 is therefore inhibition of LAT1-3TM (Accession XM_043976). Accordingly, utilities of VGAM2127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAT1-3TM. MGC13071 (Accession NM_032689) is another VGAM2127 host target gene. MGC13071 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC13071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13071 BINDING SITE, designated SEQ ID:26407, to the nucleotide sequence of VGAM2127 RNA, herein designated VGAM RNA, also designated SEQ ID:4838.

[73800] Another function of VGAM2127 is therefore inhibition of MGC13071 (Accession NM_032689). Accordingly, utilities

of VGAM2127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13071. VEZATIN (Accession NM_017599) is another VGAM2127 host target gene. VEZATIN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VEZATIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VEZATIN BINDING SITE, designated SEQ ID:19070, to the nucleotide sequence of VGAM2127 RNA, herein designated VGAM RNA, also designated SEQ ID:4838.

[73801] Another function of VGAM2127 is therefore inhibition of VEZATIN (Accession NM_017599). Accordingly, utilities of VGAM2127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VEZATIN. LOC116236 (Accession XM_057674) is another VGAM2127 host target gene. LOC116236 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC116236, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC116236 BINDING SITE, designated SEQ ID:36541, to the nucleotide sequence of VGAM2127 RNA, herein designated VGAM RNA, also designated SEQ ID:4838.

[73802] Another function of VGAM2127 is therefore inhibition of LOC116236 (Accession XM_057674). Accordingly, utilities of VGAM2127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116236. LOC122786 (Accession XM_058660) is another VGAM2127 host target gene. LOC122786 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC122786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122786 BINDING SITE, designated SEQ ID:36696, to the nucleotide sequence of VGAM2127 RNA, herein designated VGAM RNA, also designated SEQ ID:4838.

[73803] Another function of VGAM2127 is therefore inhibition of LOC122786 (Accession XM_058660). Accordingly, utilities of VGAM2127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122786. LOC145371 (Accession XM_085123) is another VGAM2127 host target gene. LOC145371 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145371 BINDING SITE, designated SEQ ID:37842, to the nucleotide sequence of VGAM2127 RNA, herein designated VGAM RNA, also designated SEQ ID:4838.

[73804] Another function of VGAM2127 is therefore inhibition of LOC145371 (Accession XM_085123). Accordingly, utilities of VGAM2127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145371. LOC162239 (Accession XM_091439) is another VGAM2127 host target gene. LOC162239 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC162239, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162239 BINDING SITE, designated SEQ ID:40055, to the nucleotide sequence of VGAM2127 RNA, herein designated VGAM RNA, also designated SEQ ID:4838.

[73805] Another function of VGAM2127 is therefore inhibition of

LOC162239 (Accession XM_091439). Accordingly, utilities of VGAM2127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162239. LOC169026 (Accession XM_095471) is another VGAM2127 host target gene. LOC169026 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC169026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169026 BINDING SITE, designated SEQ ID:40268, to the nucleotide sequence of VGAM2127 RNA, herein designated VGAM RNA, also designated SEQ ID:4838.

[73806] Another function of VGAM2127 is therefore inhibition of LOC169026 (Accession XM_095471). Accordingly, utilities of VGAM2127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169026. LOC222070 (Accession XM_168433) is another VGAM2127 host target gene. LOC222070 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222070, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC222070 BINDING SITE, designated SEQ ID:45176, to the nucleotide sequence of VGAM2127 RNA, herein designated VGAM RNA, also designated SEQ ID:4838.

[73807] Another function of VGAM2127 is therefore inhibition of LOC222070 (Accession XM_168433). Accordingly, utilities of VGAM2127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222070. LOC93333 (Accession XM_050624) is another VGAM2127 host target gene. LOC93333 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC93333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93333 BINDING SITE, designated SEQ ID:35664, to the nucleotide sequence of VGAM2127 RNA, herein designated VGAM RNA, also designated SEQ ID:4838.

[73808] Another function of VGAM2127 is therefore inhibition of LOC93333 (Accession XM_050624). Accordingly, utilities of VGAM2127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93333. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2128 (VGAM2128) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73809] VGAM2128 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2128 was detected is described hereinabove with reference to Figs. 1-8.

[73810] VGAM2128 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline Herpesvirus 3. VGAM2128 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73811] VGAM2128 gene encodes a VGAM2128 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2128 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2128 precursor RNA is designated SEQ ID:2114, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:2114 is located at position 22124 relative to the genome of Ateline Herpesvirus 3.

[73812] VGAM2128 precursor RNA folds onto itself, forming VGAM2128 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73813] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2128 folded precursor RNA into VGAM2128 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2128 RNA is designated SEQ ID:4839, and is provided hereinbelow with reference to the sequence listing part.

[73814] VGAM2128 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2128 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2128 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73815] VGAM2128 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2128 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2128 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2128 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2128 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73816] The complementary binding of VGAM2128 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2128 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2128 host target RNA into VGAM2128 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73817] It is appreciated that VGAM2128 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2128 host target genes. The mRNA of each one of this plurality of VGAM2128 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2128 RNA, herein designated VGAM RNA, and which when bound by VGAM2128 RNA causes inhibition of translation of respective one or more

VGAM2128 host target proteins.

[73818] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2128 gene, herein designated VGAM GENE, on one or more VGAM2128 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73819] It is yet further appreciated that a function of VGAM2128 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2128 include diagnosis, prevention and treatment of viral infection by Ateline Herpesvirus 3. Spe-

cific functions, and accordingly utilities, of VGAM2128 correlate with, and may be deduced from, the identity of the host target genes which VGAM2128 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73820] Nucleotide sequences of the VGAM2128 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2128 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2128 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2128 are further described hereinbelow with reference to Table 1.

[73821] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2128 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2128 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73822] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2128 gene, herein designated VGAM is inhibition of expression of VGAM2128 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM2128 correlate with, and may be deduced from, the identity of the target genes which VGAM2128 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73823] Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM_096398) is a VGAM2128 host target gene. DLG5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DLG5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLG5 BINDING SITE, designated SEQ ID:40339, to the nucleotide sequence of VGAM2128 RNA, herein designated VGAM RNA, also designated SEQ ID:4839.

[73824] A function of VGAM2128 is therefore inhibition of Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM_096398), a gene which may transmit extracellular signals to inhibit cell proliferation. Accordingly, utilities of VGAM2128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLG5. The function of DLG5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM444.MGC23937 (Accession NM_145052) is another VGAM2128 host target gene. MGC23937 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC23937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC23937 BINDING SITE, designated SEQ ID:29682, to the nucleotide sequence of VGAM2128 RNA, herein designated VGAM RNA, also designated SEQ ID:4839.

[73825] Another function of VGAM2128 is therefore inhibition of MGC23937 (Accession NM_145052). Accordingly, utilities of VGAM2128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC23937. LOC158969 (Accession XM_088728) is another VGAM2128 host target gene. LOC158969 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158969, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158969 BINDING SITE, designated SEQ ID:39922, to the nucleotide sequence of VGAM2128 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4839.

[73826] Another function of VGAM2128 is therefore inhibition of LOC158969 (Accession XM_088728). Accordingly, utilities of VGAM2128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158969. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2129 (VGAM2129) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73827] VGAM2129 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2129 was detected is described hereinabove with reference to Figs. 1-8.

[73828] VGAM2129 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline Herpesvirus 3. VGAM2129 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73829] VGAM2129 gene encodes a VGAM2129 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2129 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2129 precursor RNA is designated SEQ ID:2115, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2115 is located at position 9401 relative to the genome of Ateline Herpesvirus 3.

[73830] VGAM2129 precursor RNA folds onto itself, forming VGAM2129 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73831] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2129 folded precursor RNA into VGAM2129 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM2129 RNA is designated SEQ ID:4840, and is provided hereinbelow with reference to the sequence listing part.

[73832] VGAM2129 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2129 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2129 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73833] VGAM2129 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2129 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2129 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2129 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2129 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73834] The complementary binding of VGAM2129 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2129 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2129 host target RNA into VGAM2129 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73835] It is appreciated that VGAM2129 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2129 host target genes. The mRNA of

each one of this plurality of VGAM2129 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2129 RNA, herein designated VGAM RNA, and which when bound by VGAM2129 RNA causes inhibition of translation of respective one or more VGAM2129 host target proteins.

[73836] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2129 gene, herein designated VGAM GENE, on one or more VGAM2129 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[73837] It is yet further appreciated that a function of VGAM2129 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2129 include diagnosis, prevention and treatment of viral infection by Ateline Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2129 correlate with, and may be deduced from, the identity of the host target genes which VGAM2129 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73838] Nucleotide sequences of the VGAM2129 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2129 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2129 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2129 are further described hereinbelow with reference to Table 1.

[73839] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2129 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2129 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73840] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2129 gene, herein designated VGAM is inhibition of expression of VGAM2129 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2129 correlate with, and may be deduced from, the identity of the target genes which VGAM2129 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73841] Cysteine-rich Motor Neuron 1 (CRIM1, Accession NM_016441) is a VGAM2129 host target gene. CRIM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRIM1 BINDING SITE, designated SEQ ID:18558, to the nucleotide sequence of VGAM2129 RNA, herein designated VGAM RNA, also designated SEQ ID:4840.

[73842] A function of VGAM2129 is therefore inhibition of Cysteine-rich Motor Neuron 1 (CRIM1, Accession NM_016441). Accordingly, utilities of VGAM2129 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with CRIM1. Mannan-binding Lectin Serine Protease 1 (C4/C2 activating component of Ra-reactive factor) (MASP1, Accession NM_001879) is another VGAM2129 host target gene. MASP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MASP1 BINDING SITE, designated SEQ ID:7605, to the nucleotide sequence of VGAM2129 RNA, herein designated VGAM RNA, also designated SEQ ID:4840.

[73843] Another function of VGAM2129 is therefore inhibition of Mannan-binding Lectin Serine Protease 1 (C4/C2 activating component of Ra-reactive factor) (MASP1, Accession NM_001879), a gene which a complement-dependent bactericidal factor . Accordingly, utilities of VGAM2129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MASP1. The function of MASP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM566.Rho-associated, Coiled-coil Containing Protein Kinase 2 (ROCK2, Accession XM_038377) is another VGAM2129 host target gene. ROCK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ROCK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROCK2 BINDING SITE, designated SEQ ID:32839, to the nucleotide sequence of VGAM2129 RNA, herein designated VGAM RNA, also designated SEQ ID:4840.

[73844] Another function of VGAM2129 is therefore inhibition of Rho-associated, Coiled-coil Containing Protein Kinase 2 (ROCK2, Accession XM_038377), a gene which regulates cytokinesis, smooth muscle contraction, the formation of actin stress fibers and focal adhesions. Accordingly, utilities of VGAM2129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROCK2. The function of ROCK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM273.CASPR3 (Accession NM_033655) is another VGAM2129 host target gene.

CASPR3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CASPR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASPR3 BINDING SITE, designated SEQ ID:27386, to the nucleotide sequence of VGAM2129 RNA, herein designated VGAM RNA, also designated SEQ ID:4840.

[73845] Another function of VGAM2129 is therefore inhibition of CASPR3 (Accession NM_033655). Accordingly, utilities of VGAM2129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASPR3. FHR5 (Accession NM_030787) is another VGAM2129 host target gene. FHR5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FHR5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHR5 BINDING SITE, designated SEQ ID:25083, to the nucleotide sequence of VGAM2129 RNA, herein designated VGAM RNA, also designated SEQ ID:4840.

[73846] Another function of VGAM2129 is therefore inhibition of FHR5 (Accession NM_030787). Accordingly, utilities of VGAM2129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHR5. FLJ11726 (Accession NM_024971) is another VGAM2129 host target gene. FLJ11726 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11726, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11726 BINDING SITE, designated SEQ ID:24526, to the nucleotide sequence of VGAM2129 RNA, herein designated VGAM RNA, also designated SEQ ID:4840.

[73847] Another function of VGAM2129 is therefore inhibition of FLJ11726 (Accession NM_024971). Accordingly, utilities of VGAM2129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11726. FLJ20085 (Accession NM_017660) is another VGAM2129 host target gene. FLJ20085 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20085, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20085 BINDING SITE, designated SEQ ID:19185, to the nucleotide sequence of VGAM2129 RNA, herein designated VGAM RNA, also designated SEQ ID:4840.

[73848] Another function of VGAM2129 is therefore inhibition of FLJ20085 (Accession NM_017660). Accordingly, utilities of VGAM2129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20085. KIAA0475 (Accession NM_014864) is another VGAM2129 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:16948, to the nucleotide sequence of VGAM2129 RNA, herein designated VGAM RNA, also designated SEQ ID:4840.

[73849] Another function of VGAM2129 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM2129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0475. RAB40A, Member RAS Oncogene Family (RAB40A, Accession XM_088733) is another VGAM2129 host target gene. RAB40A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RAB40A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB40A BINDING SITE, designated SEQ ID:39929, to the nucleotide sequence of VGAM2129 RNA, herein designated VGAM RNA, also designated SEQ ID:4840.

[73850] Another function of VGAM2129 is therefore inhibition of RAB40A, Member RAS Oncogene Family (RAB40A, Accession XM_088733). Accordingly, utilities of VGAM2129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB40A. TUSP (Accession NM_020245) is another VGAM2129 host target gene. TUSP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TUSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUSP BINDING SITE, designated SEQ ID:21523,

to the nucleotide sequence of VGAM2129 RNA, herein designated VGAM RNA, also designated SEQ ID:4840.

[73851] Another function of VGAM2129 is therefore inhibition of TUSP (Accession NM_020245). Accordingly, utilities of VGAM2129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUSP. Ubiquitin Specific Protease 2 (USP2, Accession NM_004205) is another VGAM2129 host target gene. USP2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by USP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP2 BINDING SITE, designated SEQ ID:10400, to the nucleotide sequence of VGAM2129 RNA, herein designated VGAM RNA, also designated SEQ ID:4840.

[73852] Another function of VGAM2129 is therefore inhibition of Ubiquitin Specific Protease 2 (USP2, Accession NM_004205). Accordingly, utilities of VGAM2129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP2. LOC219920 (Accession XM_167787) is another VGAM2129 host target gene. LOC219920 BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by LOC219920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219920 BINDING SITE, designated SEQ ID:44806, to the nucleotide sequence of VGAM2129 RNA, herein designated VGAM RNA, also designated SEQ ID:4840.

[73853] Another function of VGAM2129 is therefore inhibition of LOC219920 (Accession XM_167787). Accordingly, utilities of VGAM2129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219920. LOC255589 (Accession XM_173060) is another VGAM2129 host target gene. LOC255589 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255589, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255589 BINDING SITE, designated SEQ ID:46314, to the nucleotide sequence of VGAM2129 RNA, herein designated VGAM RNA, also designated SEQ ID:4840.

[73854] Another function of VGAM2129 is therefore inhibition of

LOC255589 (Accession XM_173060). Accordingly, utilities of VGAM2129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255589. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2130 (VGAM2130) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73855] VGAM2130 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2130 was detected is described hereinabove with reference to Figs. 1-8.

[73856] VGAM2130 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline Herpesvirus 3. VGAM2130 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73857] VGAM2130 gene encodes a VGAM2130 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2130 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2130 precursor RNA is designated SEQ ID:2116, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2116 is located at position 23005 relative to the genome of Ateline Herpesvirus 3.

[73858] VGAM2130 precursor RNA folds onto itself, forming VGAM2130 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73859] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2130 folded precursor RNA into VGAM2130 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM2130 RNA is designated SEQ ID:4841, and is provided hereinbelow with reference to the sequence listing part.

[73860] VGAM2130 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2130 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2130 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73861] VGAM2130 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2130 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2130 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting - VGAM2130 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2130 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73862] The complementary binding of VGAM2130 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2130 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2130 host target RNA into VGAM2130 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73863] It is appreciated that VGAM2130 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2130 host target genes. The mRNA of each one of this plurality of VGAM2130 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2130 RNA, herein designated VGAM RNA, and which when bound by VGAM2130 RNA causes inhibition of translation of respective one or more VGAM2130 host target proteins.

[73864] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2130 gene, herein designated VGAM GENE, on one or more VGAM2130 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73865] It is yet further appreciated that a function of VGAM2130

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2130 include diagnosis, prevention and treatment of viral infection by Ateline Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2130 correlate with, and may be deduced from, the identity of the host target genes which VGAM2130 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73866] Nucleotide sequences of the VGAM2130 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2130 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2130 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2130 are further described hereinbelow with reference to Table 1.

[73867] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2130 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2130 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73868] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2130 gene, herein designated VGAM is inhibition of expression of VGAM2130 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2130 correlate with, and may be deduced from, the identity of the target genes which VGAM2130 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73869] Actinin, Alpha 2 (ACTN2, Accession NM_001103) is a VGAM2130 host target gene. ACTN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ACTN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACTN2 BINDING SITE, designated SEQ ID:6755, to the nucleotide sequence of VGAM2130 RNA, herein designated VGAM RNA, also designated SEQ ID:4841.

[73870] A function of VGAM2130 is therefore inhibition of Actinin, Alpha 2 (ACTN2, Accession NM_001103), a gene which an actin-binding protein with multiple roles in different cell types. Accordingly, utilities of VGAM2130 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with ACTN2. The function of ACTN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM88.Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM_012199) is another VGAM2130 host target gene. EIF2C1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EIF2C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF2C1 BINDING SITE, designated SEQ ID:14500, to the nucleotide sequence of VGAM2130 RNA, herein designated VGAM RNA, also designated SEQ ID:4841.

[73871] Another function of VGAM2130 is therefore inhibition of Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM_012199), a gene which plays an important role in the eukaryotic peptide chain initiation process. Accordingly, utilities of VGAM2130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF2C1. The function of EIF2C1 and its association with various diseases and clinical conditions, has

been established by previous studies, as described hereinabove with reference to VGAM118.PRO2000 (Accession NM_014109) is another VGAM2130 host target gene. PRO2000 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO2000, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2000 BINDING SITE, designated SEQ ID:15337, to the nucleotide sequence of VGAM2130 RNA, herein designated VGAM RNA, also designated SEQ ID:4841.

[73872] Another function of VGAM2130 is therefore inhibition of PRO2000 (Accession NM_014109). Accordingly, utilities of VGAM2130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2000. LOC150383 (Accession XM_086905) is another VGAM2130 host target gene. LOC150383 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150383, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC150383 BINDING SITE, designated SEQ ID:38945, to the nucleotide sequence of VGAM2130 RNA, herein designated VGAM RNA, also designated SEQ ID:4841.

[73873] Another function of VGAM2130 is therefore inhibition of LOC150383 (Accession XM_086905). Accordingly, utilities of VGAM2130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150383. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2131 (VGAM2131) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73874] VGAM2131 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2131 was detected is described hereinabove with reference to Figs. 1-8.

[73875] VGAM2131 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline Herpesvirus 3. VGAM2131 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73876] VGAM2131 gene encodes a VGAM2131 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2131 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2131 precursor RNA is designated SEQ ID:2117, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2117 is located at position 9609 relative to the genome of Ateline Herpesvirus 3.

[73877] VGAM2131 precursor RNA folds onto itself, forming VGAM2131 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73878] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2131 folded precursor RNA into VGAM2131 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM2131 RNA is designated SEQ ID:4842, and is provided hereinbelow with reference to the sequence listing part.

[73879] VGAM2131 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2131 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2131 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73880] VGAM2131 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2131 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2131 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

lustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2131 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2131 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73881] The complementary binding of VGAM2131 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2131 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2131 host target RNA into VGAM2131 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73882] It is appreciated that VGAM2131 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2131 host target genes. The mRNA of each one of this plurality of VGAM2131 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2131 RNA, herein designated VGAM RNA, and which when bound by VGAM2131 RNA causes inhibition of translation of respective one or more VGAM2131 host target proteins.

[73883] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2131 gene, herein designated VGAM GENE, on one or more VGAM2131 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73884] It is yet further appreciated that a function of VGAM2131 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2131 include diagnosis, prevention and treatment of viral infection by Ateline Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2131 correlate with, and may be deduced from, the identity of the host target genes which VGAM2131 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73885] Nucleotide sequences of the VGAM2131 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2131 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2131 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2131 are further described hereinbelow with reference to Table 1.

[73886] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2131 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM2131 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73887] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2131 gene, herein designated VGAM is inhibition of expression of VGAM2131 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2131 correlate with, and may be deduced from, the identity of the target genes which VGAM2131 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73888] Adrenergic, Beta, Receptor Kinase 2 (ADRBK2, Accession NM_005160) is a VGAM2131 host target gene. ADRBK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADRBK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADRBK2 BINDING SITE, designated SEQ ID:11642, to the nucleotide sequence of VGAM2131 RNA, herein designated VGAM RNA, also designated SEQ ID:4842.

[73889] A function of VGAM2131 is therefore inhibition of Adrenergic, Beta, Receptor Kinase 2 (ADRBK2, Accession NM_005160), a gene which regulates desensitization of G protein-coupled receptors. Accordingly, utilities of VGAM2131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADRBK2. The function of ADRBK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM806.TRAM (Accession NM_014294) is another VGAM2131 host target gene. TRAM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAM BINDING SITE, designated SEQ ID:15589, to the nucleotide sequence of VGAM2131 RNA, herein designated VGAM RNA, also designated SEQ ID:4842.

[73890] Another function of VGAM2131 is therefore inhibition of TRAM (Accession NM_014294). Accordingly, utilities of VGAM2131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAM.

Coenzyme Q7 Homolog, Ubiquinone (yeast) (COQ7, Accession NM_016138) is another VGAM2131 host target gene. COQ7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COQ7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COQ7 BINDING SITE, designated SEQ ID:18221, to the nucleotide sequence of VGAM2131 RNA, herein designated VGAM RNA, also designated SEQ ID:4842.

[73891] Another function of VGAM2131 is therefore inhibition of Coenzyme Q7 Homolog, Ubiquinone (yeast) (COQ7, Accession NM_016138). Accordingly, utilities of VGAM2131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COQ7. FLJ22965 (Accession NM_022101) is another VGAM2131 host target gene. FLJ22965 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22965, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22965 BINDING SITE, designated SEQ ID:22642, to the nucleotide sequence of VGAM2131

RNA, herein designated VGAM RNA, also designated SEQ ID:4842.

[73892] Another function of VGAM2131 is therefore inhibition of FLJ22965 (Accession NM_022101). Accordingly, utilities of VGAM2131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22965. SMOC1 (Accession NM_022137) is another VGAM2131 host target gene. SMOC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMOC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMOC1 BINDING SITE, designated SEQ ID:22697, to the nucleotide sequence of VGAM2131 RNA, herein designated VGAM RNA, also designated SEQ ID:4842.

[73893] Another function of VGAM2131 is therefore inhibition of SMOC1 (Accession NM_022137). Accordingly, utilities of VGAM2131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMOC1. LOC155072 (Accession XM_098661) is another VGAM2131 host target gene. LOC155072 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by LOC155072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155072 BINDING SITE, designated SEQ ID:41758, to the nucleotide sequence of VGAM2131 RNA, herein designated VGAM RNA, also designated SEQ ID:4842.

[73894] Another function of VGAM2131 is therefore inhibition of LOC155072 (Accession XM_098661). Accordingly, utilities of VGAM2131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155072. LOC202868 (Accession XM_117477) is another VGAM2131 host target gene. LOC202868 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC202868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202868 BINDING SITE, designated SEQ ID:43445, to the nucleotide sequence of VGAM2131 RNA, herein designated VGAM RNA, also designated SEQ ID:4842.

[73895] Another function of VGAM2131 is therefore inhibition of LOC202868 (Accession XM_117477). Accordingly, utilities

of VGAM2131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202868. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2132 (VGAM2132) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73896] VGAM2132 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2132 was detected is described hereinabove with reference to Figs. 1-8.

[73897] VGAM2132 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline Herpesvirus 3. VGAM2132 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73898] VGAM2132 gene encodes a VGAM2132 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2132 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2132 precursor RNA is designated SEQ ID:2118, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2118 is located at position 17602 relative to the genome of Ateline Herpesvirus 3.

[73899] VGAM2132 precursor RNA folds onto itself, forming VGAM2132 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73900] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2132 folded precursor RNA into VGAM2132 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM2132 RNA is designated SEQ ID:4843, and

is provided hereinbelow with reference to the sequence listing part.

[73901] VGAM2132 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2132 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2132 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73902] VGAM2132 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2132 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2132 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2132 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2132 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73903] The complementary binding of VGAM2132 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2132 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2132 host target RNA into VGAM2132 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73904] It is appreciated that VGAM2132 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2132 host target genes. The mRNA of each one of this plurality of VGAM2132 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2132 RNA, herein designated VGAM RNA, and which when bound by VGAM2132 RNA causes inhibition of translation of respective one or more VGAM2132 host target proteins.

[73905] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2132 gene, herein designated VGAM GENE, on one or more VGAM2132 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73906] It is yet further appreciated that a function of VGAM2132 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2132 include diagnosis, prevention and treatment of viral infection by Ateline Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2132 correlate with, and may be deduced from, the identity of the host target genes which VGAM2132 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73907] Nucleotide sequences of the VGAM2132 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2132 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2132 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2132 are further described hereinbelow with reference to Table 1.

[73908] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2132 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2132 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73909] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2132 gene, herein designated VGAM is inhibition of expression of VGAM2132 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2132 correlate with, and may be deduced from, the identity of the target genes which VGAM2132 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73910] Mel Transforming Oncogene (derived from cell line NK14)- RAB8 Homolog (MEL, Accession NM_005370) is a VGAM2132 host target gene. MEL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MEL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEL BINDING SITE, designated SEQ ID:11846, to the nucleotide sequence of VGAM2132 RNA, herein designated VGAM RNA, also designated SEQ ID:4843.

[73911] A function of VGAM2132 is therefore inhibition of Mel Transforming Oncogene (derived from cell line NK14)-RAB8 Homolog (MEL, Accession NM_005370), a gene which may be involved in vesicular trafficking and neurotransmitter release. Accordingly, utilities of VGAM2132

include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEL. The function of MEL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM40.Multiple Endocrine Neoplasia I (MEN1, Accession NM_130799) is another VGAM2132 host target gene. MEN1 BINDING SITE1 through MEN1 BINDING SITE7 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MEN1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEN1 BINDING SITE1 through MEN1 BINDING SITE7, designated SEQ ID:28288, SEQ ID:28290, SEQ ID:28292, SEQ ID:28294, SEQ ID:28297, SEQ ID:28301 and SEQ ID:5774 respectively, to the nucleotide sequence of VGAM2132 RNA, herein designated VGAM RNA, also designated SEQ ID:4843.

[73912] Another function of VGAM2132 is therefore inhibition of Multiple Endocrine Neoplasia I (MEN1, Accession NM_130799). Accordingly, utilities of VGAM2132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEN1. LOC115795

(Accession XM_056738) is another VGAM2132 host target gene. LOC115795 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC115795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115795 BINDING SITE, designated SEQ ID:36418, to the nucleotide sequence of VGAM2132 RNA, herein designated VGAM RNA, also designated SEQ ID:4843.

[73913] Another function of VGAM2132 is therefore inhibition of LOC115795 (Accession XM_056738). Accordingly, utilities of VGAM2132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115795. LOC130813 (Accession XM_065904) is another VGAM2132 host target gene. LOC130813 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC130813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130813 BINDING SITE, designated SEQ ID:37315, to the nucleotide sequence of VGAM2132 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4843.

[73914] Another function of VGAM2132 is therefore inhibition of LOC130813 (Accession XM_065904). Accordingly, utilities of VGAM2132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130813. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2133 (VGAM2133) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73915] VGAM2133 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2133 was detected is described hereinabove with reference to Figs. 1-8.

[73916] VGAM2133 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline Herpesvirus 3. VGAM2133 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73917] VGAM2133 gene encodes a VGAM2133 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM2133 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2133 precursor RNA is designated SEQ ID:2119, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2119 is located at position 4296 relative to the genome of Ateline Herpesvirus 3.

[73918] VGAM2133 precursor RNA folds onto itself, forming VGAM2133 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73919] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2133 folded precursor RNA into VGAM2133 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2133 RNA is designated SEQ ID:4844, and is provided hereinbelow with reference to the sequence listing part.

[73920] VGAM2133 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2133 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2133 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73921] VGAM2133 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2133 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2133 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2133 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2133 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73922] The complementary binding of VGAM2133 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2133 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2133 host target RNA into VGAM2133 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73923] It is appreciated that VGAM2133 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2133 host target genes. The mRNA of

each one of this plurality of VGAM2133 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2133 RNA, herein designated VGAM RNA, and which when bound by VGAM2133 RNA causes inhibition of translation of respective one or more VGAM2133 host target proteins.

[73924] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2133 gene, herein designated VGAM GENE, on one or more VGAM2133 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[73925] It is yet further appreciated that a function of VGAM2133 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2133 include diagnosis, prevention and treatment of viral infection by Ateline Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2133 correlate with, and may be deduced from, the identity of the host target genes which VGAM2133 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73926] Nucleotide sequences of the VGAM2133 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2133 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2133 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2133 are further described hereinbelow with reference to Table 1.

[73927] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2133 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2133 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73928] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2133 gene, herein designated VGAM is inhibition of expression of VGAM2133 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2133 correlate with, and may be deduced from, the identity of the target genes which VGAM2133 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73929] Adaptor-related Protein Complex 2, Beta 1 Subunit (AP2B1, Accession NM_001282) is a VGAM2133 host target gene. AP2B1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AP2B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP2B1 BINDING SITE, designated SEQ ID:6949, to the nucleotide sequence of VGAM2133 RNA, herein designated VGAM RNA, also designated SEQ ID:4844.

[73930] A function of VGAM2133 is therefore inhibition of Adaptor-related Protein Complex 2, Beta 1 Subunit (AP2B1, Ac-

cession NM_001282), a gene which links clathrin to receptors in coated vesicles. Accordingly, utilities of VGAM2133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP2B1. The function of AP2B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1126.B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_022898) is another VGAM2133 host target gene. BCL11B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCL11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL11B BINDING SITE, designated SEQ ID:23161, to the nucleotide sequence of VGAM2133 RNA, herein designated VGAM RNA, also designated SEQ ID:4844.

[73931] Another function of VGAM2133 is therefore inhibition of B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_022898). Accordingly, utilities of VGAM2133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

BCL11B. Cytochrome P450, Subfamily XIX (aromatization of androgens) (CYP19, Accession NM_031226) is another VGAM2133 host target gene. CYP19 BINDING SITE1 and CYP19 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CYP19, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP19 BINDING SITE1 and CYP19 BINDING SITE2, designated SEQ ID:25270 and SEQ ID:5560 respectively, to the nucleotide sequence of VGAM2133 RNA, herein designated VGAM RNA, also designated SEQ ID:4844.

[73932] Another function of VGAM2133 is therefore inhibition of Cytochrome P450, Subfamily XIX (aromatization of androgens) (CYP19, Accession NM_031226), a gene which catalyzes the last steps of estrogen biosynthesis. Accordingly, utilities of VGAM2133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP19. The function of CYP19 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM508.VAMP

(vesicle-associated membrane protein)-associated Protein B and C (VAPB, Accession NM_004738) is another VGAM2133 host target gene. VAPB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VAPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VAPB BINDING SITE, designated SEQ ID:11131, to the nucleotide sequence of VGAM2133 RNA, herein designated VGAM RNA, also designated SEQ ID:4844.

[73933] Another function of VGAM2133 is therefore inhibition of VAMP (vesicle-associated membrane protein)-associated Protein B and C (VAPB, Accession NM_004738). Accordingly, utilities of VGAM2133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VAPB. Chromosome 21 Open Reading Frame 25 (C21orf25, Accession XM_032945) is another VGAM2133 host target gene. C21orf25 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C21orf25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of C21orf25 BINDING SITE, designated SEQ ID:31799, to the nucleotide sequence of VGAM2133 RNA, herein designated VGAM RNA, also designated SEQ ID:4844.

[73934] Another function of VGAM2133 is therefore inhibition of Chromosome 21 Open Reading Frame 25 (C21orf25, Accession XM_032945). Accordingly, utilities of VGAM2133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf25. FLJ14735 (Accession NM_032832) is another VGAM2133 host target gene. FLJ14735 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14735, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14735 BINDING SITE, designated SEQ ID:26608, to the nucleotide sequence of VGAM2133 RNA, herein designated VGAM RNA, also designated SEQ ID:4844.

[73935] Another function of VGAM2133 is therefore inhibition of FLJ14735 (Accession NM_032832). Accordingly, utilities of VGAM2133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ14735. Methyl-CpG Binding Domain Protein 2 (MBD2, Accession NM_015832) is another VGAM2133 host target gene. MBD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MBD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBD2 BINDING SITE, designated SEQ ID:17944, to the nucleotide sequence of VGAM2133 RNA, herein designated VGAM RNA, also designated SEQ ID:4844.

[73936] Another function of VGAM2133 is therefore inhibition of Methyl-CpG Binding Domain Protein 2 (MBD2, Accession NM_015832). Accordingly, utilities of VGAM2133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBD2. MGC21738 (Accession NM_145044) is another VGAM2133 host target gene. MGC21738 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC21738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC21738 BINDING SITE, designated SEQ ID:29676, to the nucleotide sequence of

VGAM2133 RNA, herein designated VGAM RNA, also designated SEQ ID:4844.

[73937] Another function of VGAM2133 is therefore inhibition of MGC21738 (Accession NM_145044). Accordingly, utilities of VGAM2133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC21738. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 1A (PPP1R1A, Accession NM_006741) is another VGAM2133 host target gene. PPP1R1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP1R1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R1A BINDING SITE, designated SEQ ID:13590, to the nucleotide sequence of VGAM2133 RNA, herein designated VGAM RNA, also designated SEQ ID:4844.

[73938] Another function of VGAM2133 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 1A (PPP1R1A, Accession NM_006741). Accordingly, utilities of VGAM2133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R1A. LOC203248 (Accession XM_114659) is another

VGAM2133 host target gene. LOC203248 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203248 BINDING SITE, designated SEQ ID:43016, to the nucleotide sequence of VGAM2133 RNA, herein designated VGAM RNA, also designated SEQ ID:4844.

[73939] Another function of VGAM2133 is therefore inhibition of LOC203248 (Accession XM_114659). Accordingly, utilities of VGAM2133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203248. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2134 (VGAM2134) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73940] VGAM2134 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2134 was detected is de-

scribed hereinabove with reference to Figs. 1-8.

[73941] VGAM2134 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline Herpesvirus 3. VGAM2134 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73942] VGAM2134 gene encodes a VGAM2134 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2134 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2134 precursor RNA is designated SEQ ID:2120, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2120 is located at position 20245 relative to the genome of Ateline Herpesvirus 3.

[73943] VGAM2134 precursor RNA folds onto itself, forming VGAM2134 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73944] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2134 folded precursor RNA into VGAM2134 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM2134 RNA is designated SEQ ID:4845, and is provided hereinbelow with reference to the sequence listing part.

[73945] VGAM2134 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2134 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2134 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73946] VGAM2134 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2134 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2134 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2134 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2134 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73947] The complementary binding of VGAM2134 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2134 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2134 host target RNA into VGAM2134 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73948] It is appreciated that VGAM2134 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2134 host target genes. The mRNA of each one of this plurality of VGAM2134 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2134 RNA, herein designated VGAM RNA, and which when bound by VGAM2134 RNA causes inhibition of translation of respective one or more VGAM2134 host target proteins.

[73949] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2134 gene, herein designated VGAM GENE, on one or more VGAM2134 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73950] It is yet further appreciated that a function of VGAM2134 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2134 include diagnosis, prevention and treatment of viral infection by Ateline Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2134 correlate with, and may be deduced from, the identity of the host target genes which VGAM2134 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73951] Nucleotide sequences of the VGAM2134 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2134 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM2134 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2134 are further described hereinbelow with reference to Table 1.

[73952] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2134 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2134 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73953] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2134 gene, herein designated VGAM is inhibition of expression of VGAM2134 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2134 correlate with, and may be deduced from, the identity of the target genes which VGAM2134 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73954] Catenin (cadherin-associated protein), Alpha 1, 102kDa (CTNNA1, Accession XM_038221) is a VGAM2134 host target gene. CTNNA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CTNNA1, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTNNA1 BINDING SITE, designated SEQ ID:32785, to the nucleotide sequence of VGAM2134 RNA, herein designated VGAM RNA, also designated SEQ ID:4845.

[73955] A function of VGAM2134 is therefore inhibition of Catenin (cadherin-associated protein), Alpha 1, 102kDa (CTNNA1, Accession XM_038221), a gene which is a transmembrane glycoprotein responsible for physical connection of epithelial cells. Accordingly, utilities of VGAM2134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTNNA1. The function of CTNNA1 has been established by previous studies. E-cadherin is a transmembrane glycoprotein responsible for physical connection of epithelial cells through Ca(2+)-binding regions in its extracellular domain. E-cadherin-mediated cell-cell adhesion is effected by 3 cytoplasmic proteins known as catenins alpha, beta (see OMIM Ref. No. 116806), and gamma. These catenins are thought to work as connectors that anchor the E-cadherin to the cytoskeletal actin bundle through the cadherin cytoplasmic domain. Dysfunction of this adhesion complex

causes dissociation of cancer cells from primary tumor nodules, thus possibly contributing to cancer invasion and metastasis. Herrenknecht et al. (1991) and Nagafuchi et al. (1991) isolated a murine cDNA encoding the 102-kD alpha-catenin (OMIM Ref. No. CAP102). Oda et al. (1993) cloned and sequenced human alpha-catenin. They found that it shows extensive homology with that of the mouse. Hirano et al. (1992) and Shimoyama et al. (1992) showed that a human lung cancer cell line, PC9, which expresses E-cadherin but only a small quantity of abnormal-sized alpha-catenin, grew initially as isolated cells and then re-gained its cell-cell adhesion potential when transfected with alpha-catenin. Oda et al. (1993) found 2 abnormal mRNA sequences of alpha-catenin in PC9; one was a 957-bp deletion resulting in a 319-amino acid deletion and another was a 761-bp deletion resulting in a frameshift. The deletions were thought to be responsible for the loss of alpha-catenin expression. Vasioukhin et al. (2001) examined the consequences of alpha-catenin protein ablation in otherwise normal newborn mice. When surface epithelium alpha-catenin was ablated, hair follicle development was blocked and epidermal morphogenesis was dramatically affected, with defects in adherens junc-

tion formation, intercellular adhesion, and epithelial polarity. Differentiation occurred, but epidermis displayed hyperproliferation, suprabasal mitoses, and multinucleated cells. In vitro, alpha-catenin null keratinocytes were poorly contact inhibited and grew rapidly. These differences were not dependent upon intercellular adhesion and were in marked contrast to keratinocytes conditionally null for another essential intercellular adhesion protein, desmoplakin (DSP; 125647). Knockout keratinocytes exhibited sustained activation of the Ras-MAPK cascade due to aberrations in growth factor responses. The authors concluded that features of precancerous lesions often attributed to defects in cell cycle regulatory genes can be generated by compromising the function of alpha-catenin

[73956] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[73959] Further studies establishing the function and utilities of CTNNA1 are found in John Hopkins OMIM database record ID 116805, and in sited publications numbered 2025, 1072 and 11656-2033 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Leucine-rich, Glioma Inactivated 1 (LGI1, Accession NM_005097) is another VGAM2134 host target gene. LGI1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LGI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LGI1 BINDING SITE, designated SEQ ID:11564, to the nucleotide sequence of VGAM2134 RNA, herein designated VGAM RNA, also designated SEQ ID:4845.

[73960] Another function of VGAM2134 is therefore inhibition of Leucine-rich, Glioma Inactivated 1 (LGI1, Accession NM_005097). Accordingly, utilities of VGAM2134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGI1. Regulator of G-

protein Signalling 16 (RGS16, Accession NM_002928) is another VGAM2134 host target gene. RGS16 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RGS16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS16 BINDING SITE, designated SEQ ID:8834, to the nucleotide sequence of VGAM2134 RNA, herein designated VGAM RNA, also designated SEQ ID:4845.

[73961] Another function of VGAM2134 is therefore inhibition of Regulator of G-protein Signalling 16 (RGS16, Accession NM_002928), a gene which inhibits signal transduction. Accordingly, utilities of VGAM2134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS16. The function of RGS16 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1843.Formin Homology 2 Domain Containing 2 (FHOD2, Accession XM_057927) is another VGAM2134 host target gene. FHOD2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by

FHOD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHOD2 BINDING SITE, designated SEQ ID:36553, to the nucleotide sequence of VGAM2134 RNA, herein designated VGAM RNA, also designated SEQ ID:4845.

[73962] Another function of VGAM2134 is therefore inhibition of Formin Homology 2 Domain Containing 2 (FHOD2, Accession XM_057927). Accordingly, utilities of VGAM2134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHOD2. FLJ12409 (Accession NM_025105) is another VGAM2134 host target gene. FLJ12409 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12409, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12409 BINDING SITE, designated SEQ ID:24754, to the nucleotide sequence of VGAM2134 RNA, herein designated VGAM RNA, also designated SEQ ID:4845.

[73963] Another function of VGAM2134 is therefore inhibition of

FLJ12409 (Accession NM_025105). Accordingly, utilities of VGAM2134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12409. FLJ20445 (Accession NM_017824) is another VGAM2134 host target gene. FLJ20445 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20445 BINDING SITE, designated SEQ ID:19482, to the nucleotide sequence of VGAM2134 RNA, herein designated VGAM RNA, also designated SEQ ID:4845.

[73964] Another function of VGAM2134 is therefore inhibition of FLJ20445 (Accession NM_017824). Accordingly, utilities of VGAM2134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20445. FLJ20739 (Accession XM_042197) is another VGAM2134 host target gene. FLJ20739 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ20739 BINDING SITE, designated SEQ ID:33705, to the nucleotide sequence of VGAM2134 RNA, herein designated VGAM RNA, also designated SEQ ID:4845.

[73965] Another function of VGAM2134 is therefore inhibition of FLJ20739 (Accession XM_042197). Accordingly, utilities of VGAM2134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20739. FLJ30567 (Accession NM_145022) is another VGAM2134 host target gene. FLJ30567 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ30567, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30567 BINDING SITE, designated SEQ ID:29630, to the nucleotide sequence of VGAM2134 RNA, herein designated VGAM RNA, also designated SEQ ID:4845.

[73966] Another function of VGAM2134 is therefore inhibition of FLJ30567 (Accession NM_145022). Accordingly, utilities of VGAM2134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30567. KIAA0266 (Accession NM_021645) is another

VGAM2134 host target gene. KIAA0266 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0266 BINDING SITE, designated SEQ ID:22311, to the nucleotide sequence of VGAM2134 RNA, herein designated VGAM RNA, also designated SEQ ID:4845.

[73967] Another function of VGAM2134 is therefore inhibition of KIAA0266 (Accession NM_021645). Accordingly, utilities of VGAM2134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0266. KIAA1336 (Accession XM_051306) is another VGAM2134 host target gene. KIAA1336 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1336 BINDING SITE, designated SEQ ID:35804, to the nucleotide sequence of VGAM2134 RNA, herein designated VGAM RNA, also designated SEQ ID:4845.

[73968] Another function of VGAM2134 is therefore inhibition of KIAA1336 (Accession XM_051306). Accordingly, utilities of VGAM2134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1336. SKIP (Accession NM_130766) is another VGAM2134 host target gene. SKIP BINDING SITE1 and SKIP BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SKIP, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SKIP BINDING SITE1 and SKIP BINDING SITE2, designated SEQ ID:28265 and SEQ ID:18601 respectively, to the nucleotide sequence of VGAM2134 RNA, herein designated VGAM RNA, also designated SEQ ID:4845.

[73969] Another function of VGAM2134 is therefore inhibition of SKIP (Accession NM_130766). Accordingly, utilities of VGAM2134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SKIP. LOC144231 (Accession XM_096561) is another VGAM2134 host target gene. LOC144231 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144231, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144231 BINDING SITE, designated SEQ ID:40394, to the nucleotide sequence of VGAM2134 RNA, herein designated VGAM RNA, also designated SEQ ID:4845.

[73970] Another function of VGAM2134 is therefore inhibition of LOC144231 (Accession XM_096561). Accordingly, utilities of VGAM2134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144231. LOC154215 (Accession XM_087875) is another VGAM2134 host target gene. LOC154215 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC154215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154215 BINDING SITE, designated SEQ ID:39464, to the nucleotide sequence of VGAM2134 RNA, herein designated VGAM RNA, also designated SEQ ID:4845.

[73971] Another function of VGAM2134 is therefore inhibition of LOC154215 (Accession XM_087875). Accordingly, utilities of VGAM2134 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC154215. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2135 (VGAM2135) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[73972] VGAM2135 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2135 was detected is described hereinabove with reference to Figs. 1-8.

[73973] VGAM2135 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline Herpesvirus 3. VGAM2135 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73974] VGAM2135 gene encodes a VGAM2135 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2135 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2135 precursor RNA is desig-

nated SEQ ID:2121, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2121 is located at position 17990 relative to the genome of Ateline Herpesvirus 3.

[73975] VGAM2135 precursor RNA folds onto itself, forming VGAM2135 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73976] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2135 folded precursor RNA into VGAM2135 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM2135 RNA is designated SEQ ID:4846, and is provided hereinbelow with reference to the sequence

listing part.

[73977] VGAM2135 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2135 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2135 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73978] VGAM2135 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2135 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2135 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2135 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM2135 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[73979] The complementary binding of VGAM2135 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2135 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2135 host target RNA into VGAM2135 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73980] It is appreciated that VGAM2135 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2135 host target genes. The mRNA of each one of this plurality of VGAM2135 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2135 RNA, herein designated VGAM

RNA, and which when bound by VGAM2135 RNA causes inhibition of translation of respective one or more VGAM2135 host target proteins.

[73981] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2135 gene, herein designated VGAM GENE, on one or more VGAM2135 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[73982] It is yet further appreciated that a function of VGAM2135 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2135 include diagnosis, prevention and treatment of viral infection by Ateline Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2135 correlate with, and may be deduced from, the identity of the host target genes which VGAM2135 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[73983] Nucleotide sequences of the VGAM2135 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2135 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2135 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2135 are further described hereinbelow with reference to Table 1.

[73984] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2135 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2135 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[73985] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2135 gene, herein designated VGAM is

inhibition of expression of VGAM2135 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2135 correlate with, and may be deduced from, the identity of the target genes which VGAM2135 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[73986] Brain-specific Angiogenesis Inhibitor 3 (BAI3, Accession NM_001704) is a VGAM2135 host target gene. BAI3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BAI3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAI3 BINDING SITE, designated SEQ ID:7427, to the nucleotide sequence of VGAM2135 RNA, herein designated VGAM RNA, also designated SEQ ID:4846.

[73987] A function of VGAM2135 is therefore inhibition of Brain-specific Angiogenesis Inhibitor 3 (BAI3, Accession NM_001704). Accordingly, utilities of VGAM2135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAI3. KIAA0210 (Accession NM_014744) is another VGAM2135 host target gene. KIAA0210 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by KIAA0210, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0210 BINDING SITE, designated SEQ ID:16424, to the nucleotide sequence of VGAM2135 RNA, herein designated VGAM RNA, also designated SEQ ID:4846.

[73988] Another function of VGAM2135 is therefore inhibition of KIAA0210 (Accession NM_014744). Accordingly, utilities of VGAM2135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0210. KIAA1204 (Accession XM_045011) is another VGAM2135 host target gene. KIAA1204 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1204, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1204 BINDING SITE, designated SEQ ID:34311, to the nucleotide sequence of VGAM2135 RNA, herein designated VGAM RNA, also designated SEQ ID:4846.

[73989] Another function of VGAM2135 is therefore inhibition of

KIAA1204 (Accession XM_045011). Accordingly, utilities of VGAM2135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1204. LOC219988 (Accession XM_166223) is another VGAM2135 host target gene. LOC219988 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219988 BINDING SITE, designated SEQ ID:44045, to the nucleotide sequence of VGAM2135 RNA, herein designated VGAM RNA, also designated SEQ ID:4846.

[73990] Another function of VGAM2135 is therefore inhibition of LOC219988 (Accession XM_166223). Accordingly, utilities of VGAM2135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219988. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2136 (VGAM2136) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[73991] VGAM2136 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2136 was detected is described hereinabove with reference to Figs. 1-8.

[73992] VGAM2136 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2136 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[73993] VGAM2136 gene encodes a VGAM2136 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2136 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2136 precursor RNA is designated SEQ ID:2122, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2122 is located at position 176642 relative to the genome of Ectromelia Virus.

[73994] VGAM2136 precursor RNA folds onto itself, forming VGAM2136 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[73995] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2136 folded precursor RNA into VGAM2136 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM2136 RNA is designated SEQ ID:4847, and is provided hereinbelow with reference to the sequence listing part.

[73996] VGAM2136 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2136 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2136 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[73997] VGAM2136 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2136 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2136 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2136 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2136 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR

and 5`UTR regions.

[73998] The complementary binding of VGAM2136 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2136 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2136 host target RNA into VGAM2136 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[73999] It is appreciated that VGAM2136 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2136 host target genes. The mRNA of each one of this plurality of VGAM2136 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2136 RNA, herein designated VGAM RNA, and which when bound by VGAM2136 RNA causes inhibition of translation of respective one or more VGAM2136 host target proteins.

[74000] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2136 gene, herein designated VGAM GENE, on one

or more VGAM2136 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74001] It is yet further appreciated that a function of VGAM2136 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2136 correlate with, and may be deduced from, the identity of the host target genes which VGAM2136 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74002] Nucleotide sequences of the VGAM2136 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2136 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2136 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2136 are further described hereinbelow with reference to Table 1.

[74003] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2136 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2136 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74004] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2136 gene, herein designated VGAM is inhibition of expression of VGAM2136 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2136 correlate with, and may be deduced from, the identity of the target genes which VGAM2136 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74005] ADP-ribosyltransferase (NAD+; poly (ADP-ribose) Poly-

merase) (ADPRT, Accession NM_001618) is a VGAM2136 host target gene. ADPRT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADPRT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADPRT BINDING SITE, designated SEQ ID:7327, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74006] A function of VGAM2136 is therefore inhibition of ADP-ribosyltransferase (NAD+; poly (ADP-ribose) Polymerase) (ADPRT, Accession NM_001618), a gene which catalyzes addition of mono-ADP-ribose to arginine residues of proteins, inhibits Pol II transcription. Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADPRT. The function of ADPRT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM506.Cadherin 19, Type 2 (CDH19, Accession NM_021153) is another VGAM2136 host target gene. CDH19 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by CDH19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH19 BINDING SITE, designated SEQ ID:22127, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74007] Another function of VGAM2136 is therefore inhibition of Cadherin 19, Type 2 (CDH19, Accession NM_021153), a gene which is a calcium dependent cell adhesion protein. Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH19. The function of CDH19 has been established by previous studies. In EST database searches for cadherin sequences, Kools et al. (2000) identified a partial CDH19 cDNA, which they called CDH7L2. CDH19 encodes a 772-amino acid protein predicted to contain 5 EC (extracellular calcium-binding) repeats, a transmembrane domain, and a cytoplasmic tail. Kools et al. (2000) classified CDH19 as an atypical (type II) cadherin due to the lack of the HAV cell adhesion recognition sequence specific for classic cadherins. CDH19 was previ-

ously identified and named CDH7 by Kremmidiotis et al. (1998); however, phylogenetic analysis carried out by Kools et al. (2000) led to nomenclature corrections within the cadherin gene family. CDH19 shares significant homology with chicken Cdh7, but Kools et al. (2000) identified the newly designated CDH7 gene (OMIM Ref. No. 605806) as the likely human ortholog of chicken Cdh7. Using RT-PCR analysis, Kools et al. (2000) detected CDH19 expression in all tissues tested, with the exception of uterus. By somatic cell hybrid analysis and fluorescence in situ hybridization, Kremmidiotis et al. (1998) mapped the human CDH19 gene to chromosome 18q22-q23. Using the same methods, Kools et al. (2000) mapped the CDH19 gene to the same location in a cluster with CDH7 (OMIM Ref. No. 605806) and CDH20 (OMIM Ref. No. 605807).

[74008] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[74009] Kools, P.; Van Imschoot, G.; van Roy, F. : Characterization of three novel human cadherin genes (CDH7, CDH19, and CDH20) clustered on chromosome 18q22-q23 and with high homology to chicken cadherin-7. Genomics 68:

283-295, 2000. ; and

[74010] Kremmidiotis, G.; Baker, E.; Crawford, J.; Eyre, H. J.; Nahmias, J.; Callen, D. F. : Localization of human cadherin genes to chromosome regions exhibiting cancer-related loss of hetero.

[74011] Further studies establishing the function and utilities of CDH19 are found in John Hopkins OMIM database record ID 603016, and in sited publications numbered 801 and 11646 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Cytochrome B-245, Beta Polypeptide (chronic granulomatous disease) (CYBB, Accession XM_084288) is another VGAM2136 host target gene. CYBB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CYBB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYBB BINDING SITE, designated SEQ ID:37537, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74012] Another function of VGAM2136 is therefore inhibition of Cytochrome B-245, Beta Polypeptide (chronic granuloma-

tous disease) (CYBB, Accession XM_084288). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYBB. Damage-specific DNA Binding Protein 1, 127kDa (DDB1, Accession NM_001923) is another VGAM2136 host target gene. DDB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DDB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDB1 BINDING SITE, designated SEQ ID:7640, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74013] Another function of VGAM2136 is therefore inhibition of Damage-specific DNA Binding Protein 1, 127kDa (DDB1, Accession NM_001923). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDB1. Glucose-6-phosphatase, Catalytic (glycogen storage disease type I, von Gierke disease) (G6PC, Accession NM_000151) is another VGAM2136 host target gene. G6PC BINDING SITE is HOST TARGET binding site found in

the 3` untranslated region of mRNA encoded by G6PC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G6PC BINDING SITE, designated SEQ ID:5657, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74014] Another function of VGAM2136 is therefore inhibition of Glucose-6-phosphatase, Catalytic (glycogen storage disease type I, von Gierke disease) (G6PC, Accession NM_000151). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G6PC. Lysozyme (renal amyloidosis) (LYZ, Accession NM_000239) is another VGAM2136 host target gene. LYZ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LYZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LYZ BINDING SITE, designated SEQ ID:5758, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74015] Another function of VGAM2136 is therefore inhibition of Lysozyme (renal amyloidosis) (LYZ, Accession NM_000239), a gene which a bacteriolytic enzyme. Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LYZ. The function of LYZ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM929.Mannosidase, Alpha, Class 2A, Member 1 (MAN2A1, Accession NM_002372) is another VGAM2136 host target gene. MAN2A1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAN2A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAN2A1 BINDING SITE, designated SEQ ID:8177, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74016] Another function of VGAM2136 is therefore inhibition of Mannosidase, Alpha, Class 2A, Member 1 (MAN2A1, Accession NM_002372), a gene which catalyzes the final hydrolytic step in the asparagine-linked oligosaccharide

(N-glycan) maturation pathway. Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAN2A1. The function of MAN2A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1410.Mel Transforming Oncogene (derived from cell line NK14)- RAB8 Homolog (MEL, Accession NM_005370) is another VGAM2136 host target gene. MEL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MEL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEL BINDING SITE, designated SEQ ID:11843, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74017] Another function of VGAM2136 is therefore inhibition of Mel Transforming Oncogene (derived from cell line NK14)- RAB8 Homolog (MEL, Accession NM_005370), a gene which may be involved in vesicular trafficking and neurotransmitter release. Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MEL. The function of MEL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM40.Oxidation Resistance 1 (OXR1, Accession NM_018002) is another VGAM2136 host target gene. OXR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OXR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OXR1 BINDING SITE, designated SEQ ID:19733, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74018] Another function of VGAM2136 is therefore inhibition of Oxidation Resistance 1 (OXR1, Accession NM_018002). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OXR1. Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 3 (p55, gamma) (PIK3R3, Accession XM_027982) is another VGAM2136 host target gene. PIK3R3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

PIK3R3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3R3 BINDING SITE, designated SEQ ID:30608, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74019] Another function of VGAM2136 is therefore inhibition of Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 3 (p55, gamma) (PIK3R3, Accession XM_027982). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3R3. Proteasome (prosome, macropain) Activator Subunit 3 (PA28 gamma; Ki) (PSME3, Accession NM_005789) is another VGAM2136 host target gene. PSME3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PSME3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSME3 BINDING SITE, designated SEQ ID:12372, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ

ID:4847.

[74020] Another function of VGAM2136 is therefore inhibition of Proteasome (prosome, macropain) Activator Subunit 3 (PA28 gamma; Ki) (PSME3, Accession NM_005789), a gene which is the activator subunit of the proteasome (prosome macropain). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSME3. The function of PSME3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1498.RNA Binding Motif Protein 8A (RBM8A, Accession NM_005105) is another VGAM2136 host target gene. RBM8A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RBM8A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBM8A BINDING SITE, designated SEQ ID:11579, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74021] Another function of VGAM2136 is therefore inhibition of

RNA Binding Motif Protein 8A (RBM8A, Accession NM_005105), a gene which involves in the pathway of gene expression postsplicing nuclear preexport mRNPs, and newly exported cytoplasmic mRNPs. Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBM8A. The function of RBM8A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1864.SET Binding Factor 1 (SBF1, Accession XM_037447) is another VGAM2136 host target gene. SBF1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SBF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SBF1 BINDING SITE, designated SEQ ID:32626, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74022] Another function of VGAM2136 is therefore inhibition of SET Binding Factor 1 (SBF1, Accession XM_037447), a gene which is of unknown function, could be a tyrosine-phosphatase. Accordingly, utilities of VGAM2136 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with SBF1. The function of SBF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1452.Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM_004155) is another VGAM2136 host target gene. SERPINB9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SERPINB9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERPINB9 BINDING SITE, designated SEQ ID:10359, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74023] Another function of VGAM2136 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM_004155), a gene which may be a serpin serine protease inhibitor that interacts with granzyme B (GZMB). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with SERPINB9. The function of SERPINB9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM60.TIRAP (Accession NM_052887) is another VGAM2136 host target gene. TIRAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TIRAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIRAP BINDING SITE, designated SEQ ID:27478, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74024] Another function of VGAM2136 is therefore inhibition of TIRAP (Accession NM_052887), a gene which is a adapter involved in theTLR4 signaling pathway in the innate immune response. Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIRAP. The function of TIRAP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM189.Thymidine Kinase 1, Soluble (TK1, Accession

NM_003258) is another VGAM2136 host target gene. TK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TK1 BINDING SITE, designated SEQ ID:9271, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74025] Another function of VGAM2136 is therefore inhibition of Thymidine Kinase 1, Soluble (TK1, Accession NM_003258). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TK1. Transient Receptor Potential Cation Channel, Subfamily V, Member 1 (TRPV1, Accession NM_080704) is another VGAM2136 host target gene. TRPV1 BINDING SITE1 through TRPV1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TRPV1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPV1 BINDING SITE1 through TRPV1 BINDING SITE4, designated SEQ

ID:27992, SEQ ID:28000, SEQ ID:28008 and SEQ ID:20812 respectively, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74026] Another function of VGAM2136 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily V, Member 1 (TRPV1, Accession NM_080704), a gene which functions as a receptor for capsaicin. Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPV1. The function of TRPV1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM146.Chromosome 1 Open Reading Frame 19 (C1orf19, Accession XM_042962) is another VGAM2136 host target gene. C1orf19 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf19 BINDING SITE, designated SEQ ID:33839, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM

RNA, also designated SEQ ID:4847.

[74027] Another function of VGAM2136 is therefore inhibition of Chromosome 1 Open Reading Frame 19 (C1orf19, Accession XM_042962). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf19. CCR4-NOT Transcription Complex, Subunit 7 (CNOT7, Accession NM_013354) is another VGAM2136 host target gene. CNOT7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNOT7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNOT7 BINDING SITE, designated SEQ ID:15003, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74028] Another function of VGAM2136 is therefore inhibition of CCR4-NOT Transcription Complex, Subunit 7 (CNOT7, Accession NM_013354). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNOT7. COP9 Constitutive Photomorphogenic Homolog Subunit

7A (Arabidopsis) (COPS7A, Accession NM_016319) is another VGAM2136 host target gene. COPS7A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COPS7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COPS7A BINDING SITE, designated SEQ ID:18436, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74029] Another function of VGAM2136 is therefore inhibition of COP9 Constitutive Photomorphogenic Homolog Subunit 7A (Arabidopsis) (COPS7A, Accession NM_016319). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COPS7A. DKFZp547I014 (Accession NM_020217) is another VGAM2136 host target gene. DKFZp547I014 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp547I014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547I014 BINDING SITE, des-

ignated SEQ ID:21466, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74030] Another function of VGAM2136 is therefore inhibition of DKFZp547I014 (Accession NM_020217). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547I014. DKFZP586D2223 (Accession NM_018561) is another VGAM2136 host target gene. DKFZP586D2223 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP586D2223, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586D2223 BINDING SITE, designated SEQ ID:20644, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74031] Another function of VGAM2136 is therefore inhibition of DKFZP586D2223 (Accession NM_018561). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586D2223. DKFZP727C091 (Accession

XM_038689) is another VGAM2136 host target gene. DKFZP727C091 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP727C091, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP727C091 BINDING SITE, designated SEQ ID:32907, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74032] Another function of VGAM2136 is therefore inhibition of DKFZP727C091 (Accession XM_038689). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP727C091. FLJ10618 (Accession NM_018155) is another VGAM2136 host target gene. FLJ10618 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10618, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10618 BINDING SITE, designated SEQ ID:19966, to the nucleotide sequence of VGAM2136 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4847.

[74033] Another function of VGAM2136 is therefore inhibition of FLJ10618 (Accession NM_018155). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10618. FLJ10687 (Accession NM_018178) is another VGAM2136 host target gene. FLJ10687 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10687 BINDING SITE, designated SEQ ID:20008, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74034] Another function of VGAM2136 is therefore inhibition of FLJ10687 (Accession NM_018178). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10687. FLJ11184 (Accession NM_018352) is another VGAM2136 host target gene. FLJ11184 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11184, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11184 BINDING SITE, designated SEQ ID:20364, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74035] Another function of VGAM2136 is therefore inhibition of FLJ11184 (Accession NM_018352). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11184. FLJ12644 (Accession NM_023074) is another VGAM2136 host target gene. FLJ12644 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12644, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12644 BINDING SITE, designated SEQ ID:23331, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74036] Another function of VGAM2136 is therefore inhibition of FLJ12644 (Accession NM_023074). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ12644. FLJ12987 (Accession NM_025170) is another VGAM2136 host target gene. FLJ12987 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12987 BINDING SITE, designated SEQ ID:24806, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74037] Another function of VGAM2136 is therefore inhibition of FLJ12987 (Accession NM_025170). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12987. FLJ20666 (Accession NM_018333) is another VGAM2136 host target gene. FLJ20666 BINDING SITE1 and FLJ20666 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ20666, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20666 BINDING SITE1 and FLJ20666

BINDING SITE2, designated SEQ ID:20335 and SEQ ID:19581 respectively, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74038] Another function of VGAM2136 is therefore inhibition of FLJ20666 (Accession NM_018333). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20666. GFR (Accession NM_012294) is another VGAM2136 host target gene. GFR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFR BINDING SITE, designated SEQ ID:14635, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74039] Another function of VGAM2136 is therefore inhibition of GFR (Accession NM_012294). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFR. Glutamate Receptor, Ionotropic, Delta 1 (GRID1, Accession

XM_043613) is another VGAM2136 host target gene. GRID1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRID1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRID1 BINDING SITE, designated SEQ ID:33982, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74040] Another function of VGAM2136 is therefore inhibition of Glutamate Receptor, Ionotropic, Delta 1 (GRID1, Accession XM_043613). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRID1. KIAA0258 (Accession NM_014785) is another VGAM2136 host target gene. KIAA0258 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0258, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0258 BINDING SITE, designated SEQ ID:16651, to the nucleotide sequence of VGAM2136

RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74041] Another function of VGAM2136 is therefore inhibition of KIAA0258 (Accession NM_014785). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0258. KIAA0863 (Accession NM_014913) is another VGAM2136 host target gene. KIAA0863 BINDING SITE1 and KIAA0863 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0863, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0863 BINDING SITE1 and KIAA0863 BINDING SITE2, designated SEQ ID:17152 and SEQ ID:45632 respectively, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74042] Another function of VGAM2136 is therefore inhibition of KIAA0863 (Accession NM_014913). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0863. MFN2 (Accession NM_014874) is another

VGAM2136 host target gene. MFN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MFN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MFN2 BINDING SITE, designated SEQ ID:17011, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74043] Another function of VGAM2136 is therefore inhibition of MFN2 (Accession NM_014874). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MFN2. Neurolysin (metallopeptidase M3 family) (NLN, Accession NM_020726) is another VGAM2136 host target gene. NLN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NLN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NLN BINDING SITE, designated SEQ ID:21857, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74044] Another function of VGAM2136 is therefore inhibition of Neurolysin (metallopeptidase M3 family) (NLN, Accession NM_020726). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NLN. PB1 (Accession NM_018165) is another VGAM2136 host target gene. PB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PB1 BINDING SITE, designated SEQ ID:19982, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74045] Another function of VGAM2136 is therefore inhibition of PB1 (Accession NM_018165). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PB1. Protocadherin 19 (PCDH19, Accession XM_033173) is another VGAM2136 host target gene. PCDH19 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDH19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH19 BINDING SITE, designated SEQ ID:31863, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74046] Another function of VGAM2136 is therefore inhibition of Protocadherin 19 (PCDH19, Accession XM_033173). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH19. Protein Phosphatase 1, Regulatory Subunit 10 (PPP1R10, Accession NM_002714) is another VGAM2136 host target gene. PPP1R10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP1R10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R10 BINDING SITE, designated SEQ ID:8579, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74047] Another function of VGAM2136 is therefore inhibition of Protein Phosphatase 1, Regulatory Subunit 10 (PPP1R10, Accession NM_002714). Accordingly, utilities of

VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R10. Proline-rich Gla (G-carboxyglutamic acid) Polypeptide 1 (PRRG1, Accession NM_000950) is another VGAM2136 host target gene. PRRG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRRG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRRG1 BINDING SITE, designated SEQ ID:6657, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74048] Another function of VGAM2136 is therefore inhibition of Proline-rich Gla (G-carboxyglutamic acid) Polypeptide 1 (PRRG1, Accession NM_000950). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRRG1. Serum Response Factor (c-fos serum response element-binding transcription factor) (SRF, Accession NM_003131) is another VGAM2136 host target gene. SRF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SRF, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRF BINDING SITE, designated SEQ ID:9096, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74049] Another function of VGAM2136 is therefore inhibition of Serum Response Factor (c-fos serum response element-binding transcription factor) (SRF, Accession NM_003131). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRF. LOC125929 (Accession XM_064872) is another VGAM2136 host target gene. LOC125929 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC125929, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC125929 BINDING SITE, designated SEQ ID:37270, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74050] Another function of VGAM2136 is therefore inhibition of

LOC125929 (Accession XM_064872). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125929. LOC130162 (Accession XM_059406) is another VGAM2136 host target gene. LOC130162 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130162, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130162 BINDING SITE, designated SEQ ID:36984, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74051] Another function of VGAM2136 is therefore inhibition of LOC130162 (Accession XM_059406). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130162. LOC130589 (Accession NM_138801) is another VGAM2136 host target gene. LOC130589 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130589, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

lustrates the complementarity of the nucleotide sequences of LOC130589 BINDING SITE, designated SEQ ID:29023, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74052] Another function of VGAM2136 is therefore inhibition of LOC130589 (Accession NM_138801). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130589. LOC132228 (Accession XM_059581) is another VGAM2136 host target gene. LOC132228 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC132228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132228 BINDING SITE, designated SEQ ID:37021, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74053] Another function of VGAM2136 is therefore inhibition of LOC132228 (Accession XM_059581). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132228. LOC146784 (Accession XM_085588) is an-

other VGAM2136 host target gene. LOC146784 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146784, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146784 BINDING SITE, designated SEQ ID:38239, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74054] Another function of VGAM2136 is therefore inhibition of LOC146784 (Accession XM_085588). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146784. LOC153077 (Accession XM_098307) is another VGAM2136 host target gene. LOC153077 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153077 BINDING SITE, designated SEQ ID:41568, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74055] Another function of VGAM2136 is therefore inhibition of LOC153077 (Accession XM_098307). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153077. LOC158581 (Accession XM_098968) is another VGAM2136 host target gene. LOC158581 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158581, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158581 BINDING SITE, designated SEQ ID:42014, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74056] Another function of VGAM2136 is therefore inhibition of LOC158581 (Accession XM_098968). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158581. LOC221143 (Accession XM_167986) is another VGAM2136 host target gene. LOC221143 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221143, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221143 BINDING SITE, designated SEQ ID:44942, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74057] Another function of VGAM2136 is therefore inhibition of LOC221143 (Accession XM_167986). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221143. LOC221296 (Accession XM_166325) is another VGAM2136 host target gene. LOC221296 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221296 BINDING SITE, designated SEQ ID:44168, to the nucleotide sequence of VGAM2136 RNA, herein designated VGAM RNA, also designated SEQ ID:4847.

[74058] Another function of VGAM2136 is therefore inhibition of LOC221296 (Accession XM_166325). Accordingly, utilities of VGAM2136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221296. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2137 (VGAM2137) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74059] VGAM2137 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2137 was detected is described hereinabove with reference to Figs. 1-8.

[74060] VGAM2137 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2137 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74061] VGAM2137 gene encodes a VGAM2137 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2137 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2137 precursor RNA is designated SEQ ID:2123, and is provided hereinbelow with ref-

erence to the sequence listing part. Nucleotide sequence SEQ ID:2123 is located at position 174026 relative to the genome of Ectromelia Virus.

[74062] VGAM2137 precursor RNA folds onto itself, forming VGAM2137 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74063] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2137 folded precursor RNA into VGAM2137 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2137 RNA is designated SEQ ID:4848, and is provided hereinbelow with reference to the sequence listing part.

[74064] VGAM2137 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2137 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2137 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74065] VGAM2137 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2137 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2137 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2137 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM2137 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74066] The complementary binding of VGAM2137 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2137 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2137 host target RNA into VGAM2137 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74067] It is appreciated that VGAM2137 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2137 host target genes. The mRNA of each one of this plurality of VGAM2137 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2137 RNA, herein designated VGAM RNA, and which when bound by VGAM2137 RNA causes

inhibition of translation of respective one or more VGAM2137 host target proteins.

[74068] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2137 gene, herein designated VGAM GENE, on one or more VGAM2137 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74069] It is yet further appreciated that a function of VGAM2137 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2137 include diagnosis, prevention and

treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2137 correlate with, and may be deduced from, the identity of the host target genes which VGAM2137 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74070] Nucleotide sequences of the VGAM2137 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2137 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2137 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2137 are further described hereinbelow with reference to Table 1.

[74071] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2137 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2137 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74072] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2137 gene, herein designated VGAM is inhibition of expression of VGAM2137 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM2137 correlate with, and may be deduced from, the identity of the target genes which VGAM2137 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74073] Microtubule-associated Protein, RP/EB Family, Member 2 (MAPRE2, Accession NM_014268) is a VGAM2137 host target gene. MAPRE2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAPRE2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPRE2 BINDING SITE, designated SEQ ID:15546, to the nucleotide sequence of VGAM2137 RNA, herein designated VGAM RNA, also designated SEQ ID:4848.

[74074] A function of VGAM2137 is therefore inhibition of Microtubule-associated Protein, RP/EB Family, Member 2 (MAPRE2, Accession NM_014268), a gene which The functional inactivation of the APC gene product is a key event in colorectal tumorigenesis. Accordingly, utilities of VGAM2137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MAPRE2. The function of MAPRE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178.Zinc Finger Protein 255 (ZNF255, Accession NM_005774) is another VGAM2137 host target gene. ZNF255 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF255 BINDING SITE, designated SEQ ID:12347, to the nucleotide sequence of VGAM2137 RNA, herein designated VGAM RNA, also designated SEQ ID:4848.

[74075] Another function of VGAM2137 is therefore inhibition of Zinc Finger Protein 255 (ZNF255, Accession NM_005774). Accordingly, utilities of VGAM2137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF255. FLJ12488 (Accession NM_031218) is another VGAM2137 host target gene. FLJ12488 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12488, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12488 BINDING SITE, designated SEQ ID:25266, to the nucleotide sequence of VGAM2137 RNA, herein designated VGAM RNA, also designated SEQ ID:4848.

[74076] Another function of VGAM2137 is therefore inhibition of FLJ12488 (Accession NM_031218). Accordingly, utilities of VGAM2137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12488. FLJ12788 (Accession NM_022492) is another VGAM2137 host target gene. FLJ12788 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12788, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12788 BINDING SITE, designated SEQ ID:22871, to the nucleotide sequence of VGAM2137 RNA, herein designated VGAM RNA, also designated SEQ ID:4848.

[74077] Another function of VGAM2137 is therefore inhibition of FLJ12788 (Accession NM_022492). Accordingly, utilities of VGAM2137 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ12788. HSA250839 (Accession NM_018401) is another VGAM2137 host target gene. HSA250839 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSA250839, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSA250839 BINDING SITE, designated SEQ ID:20439, to the nucleotide sequence of VGAM2137 RNA, herein designated VGAM RNA, also designated SEQ ID:4848.

[74078] Another function of VGAM2137 is therefore inhibition of HSA250839 (Accession NM_018401). Accordingly, utilities of VGAM2137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSA250839. KIAA1877 (Accession XM_038616) is another VGAM2137 host target gene. KIAA1877 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1877 BINDING SITE, designated SEQ ID:32886, to the

nucleotide sequence of VGAM2137 RNA, herein designated VGAM RNA, also designated SEQ ID:4848.

[74079] Another function of VGAM2137 is therefore inhibition of KIAA1877 (Accession XM_038616). Accordingly, utilities of VGAM2137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1877. MGC3771 (Accession NM_030970) is another VGAM2137 host target gene. MGC3771 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC3771, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3771 BINDING SITE, designated SEQ ID:25234, to the nucleotide sequence of VGAM2137 RNA, herein designated VGAM RNA, also designated SEQ ID:4848.

[74080] Another function of VGAM2137 is therefore inhibition of MGC3771 (Accession NM_030970). Accordingly, utilities of VGAM2137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3771. LOC162333 (Accession XM_102591) is another VGAM2137 host target gene. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42140, to the nucleotide sequence of VGAM2137 RNA, herein designated VGAM RNA, also designated SEQ ID:4848.

[74081] Another function of VGAM2137 is therefore inhibition of LOC162333 (Accession XM_102591). Accordingly, utilities of VGAM2137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. LOC90410 (Accession XM_031534) is another VGAM2137 host target gene. LOC90410 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90410, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90410 BINDING SITE, designated SEQ ID:31400, to the nucleotide sequence of VGAM2137 RNA, herein designated VGAM RNA, also designated SEQ ID:4848.

[74082] Another function of VGAM2137 is therefore inhibition of LOC90410 (Accession XM_031534). Accordingly, utilities

of VGAM2137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90410. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2138 (VGAM2138) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74083] VGAM2138 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2138 was detected is described hereinabove with reference to Figs. 1-8.

[74084] VGAM2138 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2138 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74085] VGAM2138 gene encodes a VGAM2138 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2138 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM2138 precursor RNA is designated SEQ ID:2124, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2124 is located at position 168635 relative to the genome of Ectromelia Virus.

[74086] VGAM2138 precursor RNA folds onto itself, forming VGAM2138 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74087] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2138 folded precursor RNA into VGAM2138 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM2138 RNA is designated SEQ ID:4849, and

is provided hereinbelow with reference to the sequence listing part.

[74088] VGAM2138 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2138 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2138 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74089] VGAM2138 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2138 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2138 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing - VGAM2138 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2138 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74090] The complementary binding of VGAM2138 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2138 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2138 host target RNA into VGAM2138 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74091] It is appreciated that VGAM2138 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2138 host target genes. The mRNA of each one of this plurality of VGAM2138 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2138 RNA, herein designated VGAM RNA, and which when bound by VGAM2138 RNA causes inhibition of translation of respective one or more VGAM2138 host target proteins.

[74092] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2138 gene, herein designated VGAM GENE, on one or more VGAM2138 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74093] It is yet further appreciated that a function of VGAM2138 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2138 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2138 correlate with, and may be deduced from, the identity of the host target genes which VGAM2138 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74094] Nucleotide sequences of the VGAM2138 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2138 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2138 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2138 are further described hereinbelow with reference to Table 1.

[74095] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2138 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2138 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74096] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM2138 gene, herein designated VGAM is inhibition of expression of VGAM2138 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2138 correlate with, and may be deduced from, the identity of the target genes which VGAM2138 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74097] Cytochrome P450, Subfamily XXVIIB (25-hydroxyvitamin D-1-alpha-hydroxylase), Polypeptide 1 (CYP27B1, Accession NM_000785) is a VGAM2138 host target gene. CYP27B1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CYP27B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP27B1 BINDING SITE, designated SEQ ID:6434, to the nucleotide sequence of VGAM2138 RNA, herein designated VGAM RNA, also designated SEQ ID:4849.

[74098] A function of VGAM2138 is therefore inhibition of Cytochrome P450, Subfamily XXVIIB (25-hydroxyvitamin D-1-alpha-hydroxylase), Polypeptide 1 (CYP27B1, Accession NM_000785). Accordingly, utilities of VGAM2138 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP27B1. Glucose-6-phosphatase, Catalytic (glycogen storage disease type I, von Gierke disease) (G6PC, Accession NM_000151) is another VGAM2138 host target gene. G6PC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by G6PC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G6PC BINDING SITE, designated SEQ ID:5654, to the nucleotide sequence of VGAM2138 RNA, herein designated VGAM RNA, also designated SEQ ID:4849.

[74099] Another function of VGAM2138 is therefore inhibition of Glucose-6-phosphatase, Catalytic (glycogen storage disease type I, von Gierke disease) (G6PC, Accession NM_000151). Accordingly, utilities of VGAM2138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G6PC. KIAA0349 (Accession XM_166449) is another VGAM2138 host target gene. KIAA0349 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0349, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0349 BINDING SITE, designated SEQ ID:44340, to the nucleotide sequence of VGAM2138 RNA, herein designated VGAM RNA, also designated SEQ ID:4849.

[74100] Another function of VGAM2138 is therefore inhibition of KIAA0349 (Accession XM_166449). Accordingly, utilities of VGAM2138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0349. MIG (Accession NM_002416) is another VGAM2138 host target gene. MIG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MIG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIG BINDING SITE, designated SEQ ID:8249, to the nucleotide sequence of VGAM2138 RNA, herein designated VGAM RNA, also designated SEQ ID:4849.

[74101] Another function of VGAM2138 is therefore inhibition of MIG (Accession NM_002416). Accordingly, utilities of VGAM2138 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MIG. LOC152925 (Accession XM_087559) is another VGAM2138 host target gene. LOC152925 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152925, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152925 BINDING SITE, designated SEQ ID:39338, to the nucleotide sequence of VGAM2138 RNA, herein designated VGAM RNA, also designated SEQ ID:4849.

[74102] Another function of VGAM2138 is therefore inhibition of LOC152925 (Accession XM_087559). Accordingly, utilities of VGAM2138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152925. LOC158295 (Accession XM_098915) is another VGAM2138 host target gene. LOC158295 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158295 BINDING SITE, designated SEQ ID:41937, to

the nucleotide sequence of VGAM2138 RNA, herein designated VGAM RNA, also designated SEQ ID:4849.

[74103] Another function of VGAM2138 is therefore inhibition of LOC158295 (Accession XM_098915). Accordingly, utilities of VGAM2138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158295. LOC55885 (Accession NM_018640) is another VGAM2138 host target gene. LOC55885 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC55885, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC55885 BINDING SITE, designated SEQ ID:20710, to the nucleotide sequence of VGAM2138 RNA, herein designated VGAM RNA, also designated SEQ ID:4849.

[74104] Another function of VGAM2138 is therefore inhibition of LOC55885 (Accession NM_018640). Accordingly, utilities of VGAM2138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC55885. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 2139 (VGAM2139) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[74105] VGAM2139 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2139 was detected is described hereinabove with reference to Figs. 1-8.

[74106] VGAM2139 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM2139 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[74107] VGAM2139 gene encodes a VGAM2139 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2139 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2139 precursor RNA is designated SEQ ID:2125, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2125 is located at position 179020 relative to the genome of Ectromelia Virus.

[74108] VGAM2139 precursor RNA folds onto itself, forming VGAM2139 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[74109] An enzyme complex designated DICER COMPLEX, `dices` the VGAM2139 folded precursor RNA into VGAM2139 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM2139 RNA is designated SEQ ID:4850, and is provided hereinbelow with reference to the sequence listing part.

[74110] VGAM2139 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2139 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2139 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[74111] VGAM2139 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2139 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2139 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting - VGAM2139 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2139 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only - these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[74112] The complementary binding of VGAM2139 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2139 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2139 host target RNA into VGAM2139 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[74113] It is appreciated that VGAM2139 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2139 host target genes. The mRNA of each one of this plurality of VGAM2139 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2139 RNA, herein designated VGAM RNA, and which when bound by VGAM2139 RNA causes inhibition of translation of respective one or more VGAM2139 host target proteins.

[74114] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2139 gene, herein designated VGAM GENE, on one or more VGAM2139 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[74115] It is yet further appreciated that a function of VGAM2139 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2139 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM2139 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2139 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[74116] Nucleotide sequences of the VGAM2139 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM2139 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2139 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2139 are further described hereinbelow with reference to Table 1.

[74117] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM2139 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM2139 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[74118] As mentioned hereinabove with reference to Fig. 1, a function of VGAM2139 gene, herein designated VGAM is inhibition of expression of VGAM2139 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM2139 correlate with, and may be deduced from, the identity of the target genes which VGAM2139

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[74119] Notch Homolog 2 (Drosophila) (NOTCH2, Accession NM_024408) is a VGAM2139 host target gene. NOTCH2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NOTCH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NOTCH2 BINDING SITE, designated SEQ ID:23649, to the nucleotide sequence of VGAM2139 RNA, herein designated VGAM RNA, also designated SEQ ID:4850.

[74120] A function of VGAM2139 is therefore inhibition of Notch Homolog 2 (Drosophila) (NOTCH2, Accession NM_024408), a gene which is moderately similar to a region of murine Notch1 and contains an ankyrin repeat. Accordingly, utilities of VGAM2139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOTCH2. The function of NOTCH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM93.Guanine

Nucleotide Binding Protein (G protein), Gamma 4 (GNG4, Accession NM_004485) is another VGAM2139 host target gene. GNG4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GNG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNG4 BINDING SITE, designated SEQ ID:10807, to the nucleotide sequence of VGAM2139 RNA, herein designated VGAM RNA, also designated SEQ ID:4850.

[74121] Another function of VGAM2139 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Gamma 4 (GNG4, Accession NM_004485). Accordingly, utilities of VGAM2139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNG4. KIAA1495 (Accession XM_055080) is another VGAM2139 host target gene. KIAA1495 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1495 BINDING SITE, designated SEQ ID:36223, to the nucleotide sequence of

VGAM2139 RNA, herein designated VGAM RNA, also designated SEQ ID:4850.

[74122] Another function of VGAM2139 is therefore inhibition of KIAA1495 (Accession XM_055080). Accordingly, utilities of VGAM2139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1495. KIAA1582 (Accession XM_037262) is another VGAM2139 host target gene. KIAA1582 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1582, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1582 BINDING SITE, designated SEQ ID:32582, to the nucleotide sequence of VGAM2139 RNA, herein designated VGAM RNA, also designated SEQ ID:4850.

[74123] Another function of VGAM2139 is therefore inhibition of KIAA1582 (Accession XM_037262). Accordingly, utilities of VGAM2139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1582. LOC254826 (Accession XM_173188) is another VGAM2139 host target gene. LOC254826 BINDING SITE is HOST TARGET binding site found in the 3` untranslated
